Foreword

As was the case in previous Annual Bathing Water Reports, the results submitted by the Member States show consistent and significant improvement in the quality of both coastal and freshwater bathing areas. Once again, the biggest improvement can be noted in the quality of freshwater zones. While this is encouraging, it is not completely surprising since the compliance rates for freshwater had been seriously lagging behind. The difference in quality between coastal and freshwater zones remains marked, though the gap is gradually closing year-by-year.

It is of course important that the prescribed sampling frequency is respected. Only regular monitoring will give us – and European citizens – the information we need on water quality. Taking one water sample once every 15 days during the bathing season is not a particularly high monitoring burden when public health is at stake. Despite the significant efforts made during the 2000 bathing season, it is therefore regrettable that a number of Member States still seem to have difficulties in respecting these monitoring requirements. I have repeatedly emphasised the importance I place on access to high-quality monitoring information for all our environmental policies and I will continue to press for this priority with regard to the Bathing Water Directive too.

In this context, I am pleased to announce that the Commission adopted a Communication on 21 December 2000 on the development of a new bathing water policy. This Communication highlights, inter alia, the importance of information and reporting. It is the first in a four step approach to revising the Bathing Water Directive – the Communication launched a consultation process which will culminate in a major conference before the Commission adopts its new proposal to revise the 25-year-old Directive. The Communication provides a rough indication of the possible contents and implications of a revised Directive, although the various elements can of course only be finalised in the shape of specific proposals at the end of the consultation period.

In this respect, the Commission welcomed the wide range of reactions received from all interested stakeholders both via the written consultation process and during the Bathing Water Conference, held during Green Week 2001. The outcome of the consultation is being taken into account in drafting the proposal for a revised directive. This proposal will be tabled for discussion by the European Parliament and the Council during 2001.

With the prospect of the revision of the directive reaching its decisive stages, the importance of clean bathing waters will rise even further on the public agenda. I would therefore take this opportunity to encourage the Member States to step up their efforts to demonstrate that they can already ensure full compliance with the existing directive.

1. Introduction

A. About the report

1. Subject of the report

This report is published annually ⁽¹⁾ by the Commission prior to the bathing season of the current year. Its purpose is to inform the public of the quality of bathing areas in the Community's various Member States over the past year. This report therefore relates to the 2000 bathing season. It also covers the evolution in the quality of bathing water in relation to previous bathing seasons (from 1992 to 2000).

The report is based on the results of bathing area monitoring programmes implemented by the Member States. The following parts explain how these monitoring programmes are established and how the Commission makes the quality assessment.

The purpose of this report is not to compare the various Member States. There are considerable differences between countries as to the number of beaches monitored, sampling frequencies and geographic situations. Moreover, the different meteorological conditions (which are at times extreme) present in the various Member States in the same bathing season place them in very different conditions, which means that each Member State begins each bathing season on a different starting block. We should, however, note that the standards set by the directive are the same for all Member States and that regardless of the country or region being examined and regardless of its climatic conditions, the compliance or non-compliance values allocated to the various bathing areas have exactly the same meaning and therefore the same value.

2. What are the requirements under Directive 76/160/EEC ⁽²⁾?

The competent authorities in the Member States are responsible for the execution of

the requirements of the bathing water quality directive. This means, in practice, that they have to establish and implement monitoring programmes. This is a step-wise process containing the following elements:

1. The identification of bathing areas according to the definition given in Article 1 (2a) of the directive:

All running or still fresh waters or parts thereof and sea water, in which:

- bathing is explicitly authorised by the competent authorities,
- bathing is not prohibited and is traditionally practised by a large number of bathers.

This means that not every stretch of water must be identified as bathing water. In practice this means that at least all natural stretches of water which are (commercially) exploited — for example entrance fee to be paid, those equipped with sanitary accommodation, which is often the case with freshwater bathing areas — and most of Europe's coastal beaches in well-known tourist areas are identified by the competent authorities.

2. The determination of the length of the bathing season according to the definition given in Article 1 (2c) of the directive:

The bathing season is the period during which a large number of bathers can be expected in the light of local custom, and any local rules that may exist concerning bathing and weather conditions.

This can be done locally, regionally or nationally. In average, within the EU, this means from the end of May till the end of September.

⁽¹⁾ Pursuant to Article 13 of Directive 76/160/EEC of 8 December 1975 (see annex to this report) modified by Article 3 of Directive 91/692/EEC (the so-called 'reporting directive').

⁽²⁾ OJ L 31, 5.2.1976, p. 1.

3. The sampling of the bathing waters during the bathing season. According to Article 6 of the directive, samples should be taken at the place where most bathers can be found and with a specific frequency. The sampling cannot thus be done at randomly chosen moments. The basic rule is a fortnightly sampling and visual and olfactory inspection of the water during the bathing season, plus one additional sample 14 days before the start of the bathing season. For some bathing areas a frequency reduction is granted on the basis of good bathing water quality during the previous two years. The additional sample before the season remains obligatory.

4. The analysis of the water samples by a qualified laboratory (or laboratories). The samples are, in general, analysed as quickly as possible after they have been taken. However, when this is not possible (for example if there is a long distance between the sampling point and the laboratory) utmost care is taken to carefully store and transport the samples. The samples should normally be analysed for all parameters listed in Annex 1 of the directive. However, for some of these parameters no limit values are set and/or derogations on the sampling frequency are foreseen. Priority is therefore given to those parameters that are taken into account for the status calculation as reported in this yearly report: two microbiological parameters — total and faecal coliforms — and three physico-chemical parameters — mineral oils, surface active substances (lasting foam as a result of the presence of detergents) and phenols.

5. Information to the public during the bathing season. Although the directive does not foresee an explicit in-season reporting, the Commission recommends that the analysis results be posted at a central point of the bathing area. This recommendation is followed at almost all identified bathing areas in the Member States, often accompanied by other relevant information, such as provisions on beach safety, zoning, etc.

6. Reporting to the European Commission. Before 31 December, Member States report the results of the sampling to the Commission. The Commission then publishes, on the basis of these results, this report with the quality assessments and updates the Internet site before the start of the next bathing season.

3. How does the Commission come to the results that are presented in this report?

The Commission receives from the Member States the pass/fail assessment ⁽³⁾ of the samples for the different parameters. The Commission does not receive the actual analysis results, the so-called 'raw data'. The Commission first checks if the required number of samples is taken on the basis of the length of the bathing season and whether a frequency reduction has been allowed. Secondly, according to the number of passed or failed samples, an assessment is made as to whether the water is in conformity with the imperative (minimum) values or with the stricter guide values.

B. Things you need to know to better understand the issue of bathing water quality

1. Microbiological contamination of bathing water

The following pages illustrate the processes involved in microbiological contamination of bathing water.

⁽³⁾ This means whether the sample did or did not comply with the imperative values and with the guide values set out in the annex of the directive.

1.1. Setting the scene

Imagine an agglomeration (big or small) near a bathing area, consisting of urban settlements and some industrial development. The agglomeration is, in principle, connected to a wastewater collection network, because first of all it is obligatory (under EU Directive 91/271/EEC – urban waste water treatment) for all agglomerations producing wastewater quantities for more than 2 000 people and secondly because there is concern about the importance of the nearby bathing area for the development of its tourism. The collection network should be connected to a waste water treatment plant.

Industry uses water in its production processes for cooling, cleaning, etc. Nearby agricultural activity is a particular source of pollution if it is situated in the catchment area of a (little) river discharging directly into a stretch of water with bathing areas.

1.2. Microbiological contamination, and what causes it

Besides the clearly visual pollution by discharges of chemicals, some of which might be accidental, and illegal dumping or wash-off of solid waste, a major part of water pollution is caused by potentially health-threatening micro-organisms, such as bacteria and viruses.

The first possible microbiological contaminator is humans. You always have someone somewhere carrying pathogens in their body (whether they make this person ill or not). The larger the city, the higher the risk that a human contaminator is present. The human pathogens then get into the waste water network via toilets.

The second possible microbiological contaminator is animals. All animals carry a certain quantity of micro-organisms in their digestion system that are potentially threatening for humans. Dog droppings, for

example, can get into the wastewater network when pavements and streets are 'flushed' after heavy rainfall. Farmers spread manure (from pigs or cows) onto their land as fertiliser. They are not always careful when doing this or there is a wash-off effect after heavy rainfall and as a result some of it ends up directly in a nearby river or stream. Similarly, if farmers are not careful when storing manure, some of it leaches into surface or groundwater. In these cases, the polluted water does not go through a waste water treatment plant before reaching the bathing area.

The third possible microbiological contaminator is certain types of industry, in particular the agro-food industry: slaughter houses and meat processing factories, tanneries, milk processing, etc.

The presence of microbiological pathogens are generally measured by means of the presence of faecal indicator germs, such as faecal coliforms or faecal streptococci.

1.3. Wastewater treatment

There are approximately three types of wastewater treatment and a preliminary process called pre-treatment.

Pre-treatment is the removal of stones, sand and fat/grease, using mechanical processes, such as screening, settlement or flotation.

Primary treatment is the removal of suspended solids (bigger than 5µm) by passing wastewater (sometimes after particular chemicals are added) through settlement or flotation tanks. This treatment does not remove many of the indicator germs, nor the pathogens.

Secondary treatment is a biological treatment: waste water passes through tanks where bacteria eat pollutants (mainly organic material) and transform it into sludge. If the sludge does not contain too many heavy metals or other dangerous substances, it can

be used as a fertiliser. Otherwise it must be disposed of by incineration or in a landfill. A well-functioning treatment plant with secondary treatment can reduce the quantities of organic material by up to 90 % and reduce the presence of faecal indicator germs (thus, we can assume the presence of pathogens) by up to 99 %. One also has to bear in mind that a number of the faecal indicator germs disappear naturally (they die or are eaten by germ predators). The fact that a certain quantity of indicator germs is not removed is not necessarily harmful, depending on the quality and quantity of the receiving water. However, if the treatment plant has to cope with heavily polluted water, a large number of the indicator germs are still present after secondary treatment. The same situation might occur in case of a plant failure or an overflow.

More advanced treatment involves nutrient removal or disinfection. Nutrients, such as nitrates and phosphates, can be removed by certain specific bacteria or by adding chemicals. The best known techniques of disinfection are chlorination, UV radiation or ozone treatment. However, while chlorination might kill the indicator germs, the pathogens might be resistant to this treatment, which might create a false idea of safety. UV radiation or ozone treatment are more reliable. One has to bear in mind that this more advanced treatment is not always necessary. It largely depends on the type and quality of the receiving water and the original level and type of pollution of the waste water.

1.4. Receiving water bodies and 'natural' water treatment

The behaviour of indicator organisms and pathogens differs according to the characteristics of the receiving water body. We have to make a clear distinction, on the one hand, between sea water and fresh or inland water and, on the other hand, between cold and warm water. Sea water, because of its high salinity is particularly hostile to pathogens and indicator germs. Pathogens and indicator germs go to an inactivated status (and can thus survive longer) in colder water.

Moreover, currents, wind and the tide and the enormous volume of the sea play an important role in the dilution of treated or untreated wastewater. Sunlight provides natural UV radiation which is more effective when treated or untreated wastewater is sufficiently diluted.

All this explains why inland waters (rivers and lakes) are in general much more vulnerable to discharges of waste water than sea water.

However, if the discharged quantities of waste water are too large and natural conditions are not favourable, further natural water treatment is not sufficient and waste water may appear or reappear at a bathing area.

1.5. Contamination of bathers

The only way of getting pathogens in your body is by swallowing quantities of water, sometimes even small quantities, which happens when you submerge completely in the water when swimming or playing in the water. Everybody can get contaminated, but small children, the elderly and people already weakened by illness or fatigue are more vulnerable to microbiological contamination.

1.6. Full circle

Some bathers become carriers of microbiological contaminants. Although the microorganisms are then back in their natural host environment and will multiply, they will not necessarily make all their hosts ill. The most common symptoms associated with bathing are: gastric-intestinal symptoms, such as diarrhoea or vomiting, ear/eye/respiratory symptoms and skin irritation. There is no real need to panic; they can ruin your holiday but they are not lethal. In any case humans return a fair quantity of microbiological pathogens back into the contamination circle.

2. Causes of (continued) non-conformity with the requirements for the two microbiological parameters set out in the directive

Since its adoption in 1976, the directive has led to an enormous improvement of bathing water quality, in particular for seaside beaches, in most Member States. However, since nowhere in the Union has reached 100 % compliance (more than 20 years after the adoption of the directive) and some bathing areas have remained non-compliant with the requirements of the directive for many years, the question is often asked: how is that possible?

Without accepting this situation, the Commission feels that it is important that citizens know that there are different sources of pollution which need different remedial action or that some remedial actions contain larger action plans than simply wastewater treatment.

The easiest to detect and to tackle are 'point sources' of pollution: this means that the pollution is attributable to a particular source, for example the wastewater discharge of a factory into a river. In the case of bad bathing water quality the following situations are the most common 'point sources' of pollution:

- direct discharges of untreated or insufficiently treated wastewater into the bathing area or its feeding waters;
- malfunctioning of treatment facilities;
- temporary failure of treatment facilities or waste water pumping stations;
- stormwater overflows from combined collecting networks (wastewater and rainfall are collected and transported by the same sewerage system) or the treatment plant.

The solution to this kind of problem is, in most cases, the construction of wastewater

collection networks and their connection to treatment facilities, the construction of treatment facilities, the repair of installations and installation of some sort of remote or video control of the pumping stations, and the modification or extension of existing collecting and treatment installations including stormwater retention and treatment.

It is also to be borne in mind that the actual deadlines for different types of treatment depending on the size of the agglomeration, as set out by the urban waste water treatment directive ^(*), are 1998, 2000 and 2005.

On the other hand, experience across the whole Community has shown that, whilst the major cause of non-compliance was removed by waste water collection and treatment, smaller or 'diffuse' sources of pollution were revealed and, in certain cases, sources of some pollution remain unidentified for the moment. The most important 'diffuse' sources of pollution are:

- leaks in older sewerage networks or at joints between houses and public sewers;
- agricultural run-off (both from pasture and arable land);
- changes in tidal or current movements which cause discharged (treated or untreated) wastewater to come ashore and contaminate bathing areas.

These problems are less evident to identify and less easy to tackle. In many cases it takes several bathing seasons before the actual source or process is identified. In the case of, for example, agricultural run-off, only a larger programme of improved agricultural practices might bring a solution. In any case, it is much better that the source and its scope is identified than not knowing at all what is going on.

^(*) OJ L 135, 30.5.1991, p. 40.

C. Legal proceedings

By joining the European Union, Member States agree to accept the obligations set out in the EC Treaty and the laws made under it. However, Member States often fail to fulfil these obligations. When this occurs, the European Commission may start an infringement procedure against a Member State on the basis of Article 226 (ex-169)⁽⁹⁾ of the EC Treaty. A Member State fails to fulfil an obligation if it has failed to transpose EC law into national legislation on time, has incorrectly transposed EC law or has incorrectly applied EC law in practice.

An infringement procedure follows a strict pattern consisting of four stages. The principal aim of the procedure is to solve the problem at the earliest possible stage, and not to end up at the Court of Justice. The first two stages take place in strict confidence between the Commission and the Member State. A press communication will normally be delivered when a reasoned opinion has been decided.

What do the different stages entail?

Stage 1: 'A pre-226 letter'. Such a letter would be sent to the national authorities of a Member State to inform them about an alleged breach of EC legislation. The Commission frequently receives information concerning alleged breaches of EC law. This information is often incomplete or does not clearly specify the exact problem in the relevant Member State, which may lead to a misunderstanding about certain elements of a case. 'A pre-226' letter allows for an exchange of information between the Commission and the Member State and enables the Commission to clarify the factual situation and gain a greater legal understanding of the alleged breach. This stage is not obligatory, as the Commission can start the procedure directly from stage 2, for example where there is a clear breach of EC law.

Stage 2: A letter of formal notice. If it is clear that a Member State has not fulfilled its obliga-

tions, then the Commission may send a letter of formal notice to the Member State stating the elements of the infringement. A Member State then has two months to reply. The reply generally contains the national legal texts through which the EU legislation has been transposed, or the measures that have been taken to fulfil these obligations.

These first two stages are not a 'public' process. This procedure is carried out on a bilateral basis between the services responsible within the Member State and the Commission, involving, of course, the respective legal services. In many cases the procedure ends here.

The following stages are the 'public' part of the procedure. There are no more direct contacts between the services responsible and the procedure is now taken up fully by the legal services.

Stage 3: A reasoned opinion. If the Commission is not satisfied with the reply given by the Member State, it may send a reasoned opinion, detailing the reasons why the Member State has still not complied with EC legislation. A Member State then has two months to comply with the reasoned opinion or to explain why it does not agree with the Commission's opinion.

Stage 4: Court of Justice in Luxembourg. The Commission may decide to put the case before the Court and so would send an application to the Court. The Court case is similar to a normal legal case with legal statements prepared by lawyers, questions posed by the judges and finally a ruling of the Court. If the Court considers that a

⁽⁹⁾ Article 226 of the Treaty states 'If the Commission considers that a Member State has failed to fulfil an obligation under this Treaty, it shall deliver a reasoned opinion on the matter after giving the State concerned the opportunity to submit its observations. If the State concerned does not comply with the opinion within the period laid down by the Commission, the latter may bring the matter before the Court of Justice.'

Member State is indeed in breach of its obligations under EC law, it will declare that in its ruling. The rulings of the Court of Justice are published in the European Court reports. The judgment of the Court is only declaratory, which means that it does not change the legal situation. Therefore, a Member State would need to take the necessary measures to comply with the Court's ruling, for example by adopting new legislation.

The whole procedure takes quite some time, depending, of course, on the complexity of the issue. It is difficult to set an average time span, but one should count at least on one year for stages 1-3 and two years for stage 4.

An infringement procedure generally ends with the ruling of the Court. The Member State must then take the necessary measures to comply with the Court's ruling. If a Member State fails to do so, the Commission has the power to go a step further and to start a new procedure which may result in the Court imposing a financial penalty on the Member State. This is called Article 228 (ex-171) procedure, which refers to the particular provision of the Treaty ⁽⁶⁾.

⁽⁶⁾ Article 228 of the Treaty states:

1. If the Court of Justice finds that a Member State has failed to fulfil an obligation under this Treaty, the State shall be required to take the necessary measures to comply with the judgment of the Court of Justice.

2. If the Commission considers that the Member State concerned has not taken such measures it shall, after giving the Member State the opportunity to submit its observations, issue a reasoned opinion specifying the points on which the Member State concerned has not complied with the judgment of the Court of Justice.

If the Member State concerned fails to take the necessary measures to comply with the Court's judgment within the time limit laid down by the Commission, the latter may bring the case before the Court of Justice. In so doing it shall specify the amount of the lump sum or penalty payment to be paid by the Member State concerned which it considers appropriate in the circumstances.

If the Court of Justice finds that the Member State concerned has not complied with its judgment it may impose a lump sum or penalty payment on it.

D. Revision of the bathing water directive

The Commission adopted on 21.12.2000 its communication on the development of a new bathing water policy. This communication is the first of a four-step approach — communication, consultation, conference, proposal — in the revision of the 25-year-old Bathing Water Directive 76/160/EEC.

Although the current Bathing Water Directive 76/160/EEC is more than 25 years old, its continued importance is evident each bathing season as it protects the public from accidental and chronic pollution discharged in or near European bathing areas. Furthermore, the overall quality of bathing waters has improved considerably since the directive came into force. Changes in science and technology, however, oblige the Commission to revise and update its legislation at regular intervals. It is now time for the bathing water directive to be revised. Its revision will be a keystone for streamlining the European environmental water legislation.

The four-stage process (i.e. communication, consultation, conference, proposal) that has been chosen for developing a new bathing water directive is similar to the one that was used for the preparation of the water framework directive. It is based on transparency, stakeholder participation and commitment and shared responsibility. The purpose of the communication is to launch an open consultation exercise. The objective of the consultation is to learn how we can improve our bathing water legislation and its implementation. This document provides a rough sketch of the expected contents and implications of a revised directive although the various elements have not yet crystallised into specific articles.

The revision of the bathing water directive will maintain, or possibly even upgrade, the rigour of the existing directive. The revised directive will still contain specific targets which will be tough and ambitious and which will have to be met within specific

timeframes. It is also the Commission's intention to rationalise and optimise the implementation of bathing water quality management through various steps, including reducing the number of parameters to be monitored, and through introducing new tools and more robust parameters. A revised directive will above all provide better information to the public.

The specific issues mentioned in the document are: the identification of bathing areas, compliance mechanisms, surveys and monitoring, trends in water quality, standard setting and methods of analysis, the obligation to take action, the prediction of water quality, information requirements, public participation and reporting and how to keep the bathing water directive up to date.

E. Information to the public

Most of the Member States distribute information on the quality of their bathing areas through the written press, television, videotext or via the Internet during the bathing season and present a summary report shortly after the bathing season.

For more detailed information, citizens may always contact the national authority responsible for this sector in their country. Similarly, they may request any documentation by contacting the Commission's representative in each Member State.

In order to identify and monitor more bathing areas, citizens are invited to contact their national competent authority or the Commission's representative office (see page 17), as well as the Commission department in Brussels which is in charge of this area, if they see that a bathing site which they regularly visit could be governed by this directive, but is not mentioned in the Atlas.

The EU Internet site and those of the Member States

The information in this report is merely a snapshot of the water quality status during a particular bathing season. Although more and more elements are introduced to allow a multi-annual evaluation for the water quality in each Member State as a whole, a paper report does not present multi-annual information for each and every bathing area. The Commission — which is always looking to facilitate the dissemination of results and encourage citizens to commit themselves to, and participate in, the monitoring of the quality of bathing water — therefore presents this information on the Internet.

You can find this 'extended' version of the 'Quality of bathing water' report on the 'Water' homepage of the DG Environment site at the Commission's 'Europa' site:

http://europa.eu.int/water/water-bathing/index_en.html

If you want more EU information or want to ask particular questions about water-related issues please contact:

E-mail: water@cec.eu.int

More and more Member States have information concerning their bathing areas on the Internet. Some have information almost on-line. Others take a bit more time to update their sites.

2. ATLAS

A. How is the information presented?

The 'Atlas' shows, for each Member State, the compliance rate for each bathing zone identified with regard to two microbiological parameters (1 and 2): 'total coliforms' and 'faecal coliforms' and three physico-chemical parameters (8, 9 and 10), which may be seen in the directive's technical annex: mineral oils, surface-active substances and phenols.

The maps and lists of each Member State's bathing areas — presented on one or more double-page spreads, depending on the number of coastal and freshwater bathing areas — are preceded by three pages containing general information on bathing water quality of both the freshwater and coastal zones: trends, compliance calculations, general information on wastewater treatment and the dissemination of information to the public, cross-reference tables allowing a comparison between the bathing season in question and the previous bathing season, etc.

Left-hand page

Bathing areas are classified by administrative entities and numbered.

The description of a bathing area includes its identification number and whether or not it complies — symbolised by a colour symbol — assessed on the basis of two microbiological parameters ('total coliforms and faecal coliforms'), and three physico-chemical parameters ('mineral oils, surface-active substances and phenols'), for which the directive stipulates a minimum sampling frequency and mandatory values which are not to be exceeded.

Right-hand page

The maps which appear on the right-hand pages contain the same information as those on the left-hand pages, with the exception of the descriptions of bathing areas.

Bathing areas (○ = sea water or △ = fresh water) are listed on the right-hand pages by administrative entity in continuous series. Only the first and last bathing areas belonging to the administrative entity in question are numbered. The identification of a non-numbered zone may be obtained by interpolation. Information (identification and compliance) on each point represented on the map may be found on the opposite page.

Zones are classified by colour code:

Zones sufficiently sampled

- ▲ ● blue symbol: bathing area complies with guide values ⁽¹⁾, water of good quality
- ▲ ● green symbol: bathing area complies with mandatory values ⁽²⁾, water of acceptable quality
- ▲ ● red symbol: bathing area does not comply or was not sampled, water of insufficient quality

Zones insufficiently sampled

- ▲ ● orange symbol: frequency sampling too low, but the various parameters measured comply with mandatory values, a beach whose water quality is insufficiently monitored
- ▲ ● red symbol: bathing area not sampled or insufficiently sampled and not complying with the minimum standards in the directive

Zones closed to bathing by Member State

- ▲ ● black symbol: bathing area where bathing was prohibited for the duration of the bathing season

Two other symbols are used on the left-hand pages of the Atlas:

- ⊕ to the left of a colour symbol means that this bathing zone's quality status has improved compared to the previous bathing season,
- ⊖ to the left of a colour symbol means that this bathing zone's quality status has deteriorated compared to the previous bathing season.

If there is no ⊕ or ⊖ to the left of a colour symbol, it means that there has been no change in the quality status of the bathing zone compared to the previous bathing season.

B. How to read the cross-reference tables

In the relevant introductory sheets relating to each Member State, the reader will find cross-reference tables — one for the coastal zones and one for freshwater zones. By using these tables, it is possible to compare the results for the bathing season covered by the report (year X) with the results for the previous bathing season (year X-1). Reading and understanding these tables constitutes a particularly useful tool providing an unambiguous display of whether and how changes have taken place. The tables indicate which bathing zones have retained the same status from one bathing season to another and show whether performance levels in the various categories have moved up or down (i.e. whether or not the results comply with the standards laid down in the directive).

⁽¹⁾ Compliance with the more rigorous guide values for the two microbiological parameters and compliance of the three physio-chemical parameters with the minimum mandatory values.

⁽²⁾ Compliance with the minimum mandatory values for both the two microbiological parameters and the three physio-chemical parameters.

Type of bathing zones

Microbiological and physico-chemical
parameters considered

Year X-1	Year X	(1)				X
(2)	(5)	(3)				(6)
					(8)	
				(7)		
		(9)				
X-1		(4)				(10)

1

The figures shown in row 1 of the cross-reference table refer to the bathing zones accounted for during the bathing season covered by the report.

Each cell shows the number of bathing zones concerned in relation to their quality status (Ban, NS, NC, Freq, C(I), C(G)). The first cell (DEL) gives the number of bathing zones that have been withdrawn compared with the previous bathing season. The last cell gives the total number of bathing zones recorded for the season in question.

2

The figures shown in column 2 of the cross-reference table refer to the bathing zones accounted for during the previous bathing season.

Each cell shows the number of bathing zones concerned as a function of their status. The first cell (New) gives the number of new bathing zones added for the bathing season referred to in the report. The last cell gives the total number of bathing zones accounted for during the previous bathing season.

3 and 4

Row 3 of the cross-reference table shows the status of the bathing zones added for the season analysed in the report. The figure shown in each cell indicates the number of new bathing zones depending on their relevant status.

Row 4 of the cross-reference table shows, for the season in question, the status of the bathing zones which were also accounted for during the previous bathing season. The first cell in this row (DEL) shows the number of bathing zones that have been excluded for the analysis exercise covering the bathing season dealt with in this report.

5 and 6

Column 5 of the cross-reference table shows the status of the bathing zones that have been withdrawn compared with the previous bathing season. The figure shown in each cell indicates the number of bathing zones and their relevant status during the previous season.

Column 6 of the cross-reference table shows, for the bathing season covered by this report, the status during the previous bathing season of the bathing zones concerned. The first cell in this row (NEW) shows the number of new bathing zones that have been added for the analysis exercise covering the bathing season in question.

7

The figures shown in the cells arranged diagonally within the table indicate, for each status level, the number of bathing zones whose status has not changed compared with the previous bathing season. The figure in cell 10 represents the total number of bathing zones that have not undergone any change in status (this figure, divided by the total number of bathing zones in respect of which records have been kept during the previous bathing season, gives the percentage of bathing zones whose status has not undergone any change from one bathing season to another).

8

The figures to the right of this diagonal — in the blue zone — show, for each status level under consideration, the number of bathing zones whose status has improved compared with the previous bathing season. The more to the right on a row, the greater the improvement in status.

9

The figures to the left of this diagonal — in the red zone — show, for each status level under consideration, the number of bathing zones whose status has deteriorated compared with the previous bathing season. The more to the left on the row, the greater the deterioration in status.

Ratio

The ratio is an indicator reflecting changes in the average quality of bathing water from one bathing season to another. It provides information on the significance of any shift in the status of bathing zones, also accounted for during the previous bathing season, towards a more favourable status (blue zone (8)) or a less favourable status (red zone (9)) during the bathing season covered by this report.

The ratio is thus calculated by taking the number of bathing zones that have 'slipped' into the blue zone (8), divided by the number of bathing zones that have slipped into the red zone (9). The higher the figure (>1) the more positive the slide and the greater the improvement in the average status of the bathing zones vis-à-vis the previous bathing season. The lower the figure (<1) the more negative the slide and the greater the deterioration in the average status of the bathing zones vis-à-vis the previous bathing season. Retention of the status quo would be expressed by a ratio of 1. This ratio does not take account of the bathing zones added/withdrawn for the bathing season covered by the report. Consequently, an element of bias may be introduced if a significant number of bathing zones has been added/withdrawn in relation to the total number of bathing zones considered during the previous bathing season.

Stability index

The objective of the stability index is to indicate the proportion of the bathing areas which have maintained the same status as in the previous bathing season. *Consequently, the stability index is in no way an indicator of average bathing water quality.* It is a value expressed as a percentage, i.e. between 0 and 100 %. A stability index close to 100 indicates that only a small proportion of the bathing areas have changed status compared with the previous bathing season. A low stability index indicates that the status of many bathing areas has changed (whether positively or negatively) since the previous bathing season.

The index is calculated by adding together the totals for the number of bathing areas showing no change of status since the previous bathing season (along the diagonal in the cross reference table) and then dividing the result by the total number of bathing areas monitored during both of the two consecutive bathing seasons. Consequently, bathing areas withdrawn since the previous bathing season or new bathing areas added during the new bathing season are not taken into account. The percentage is obtained by multiplying the result by 100.

Unlike the ratio, which is an indicator reflecting changes in the average quality of bathing water from one bathing season to another, the stability index expresses the scale of changes of status observed from one bathing season to the next, regardless whether positive or negative.

The stability index must therefore be interpreted in the light of the ratio and of the number of bathing areas actually monitored. Clearly, the higher the compliance rate, the greater the advantage of a high stability index. Conversely, if the compliance rate is low in one bathing season, it will be more advantageous to have a low stability index for the next season, although, in this case, it must be coupled with a high ratio (over 1).

Working example:

With a view to providing the reader with a better insight into the cross-reference tables, an example is given below. It does not refer to any Member State in particular or to any particular bathing season.

Freshwater zones

(TC, FC, MO, SA, PHE)

	1998	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Total 98
1997		32	1	0	137	45	426	1 220	1 829
NEW	15		1				3	11	15
Ban	0								0
NS	0								0
NC	85	6			19		25	35	79
Freq	185	12			6	45	18	104	173
C (I)	327	4			37		155	131	323
C (G)	1 249	10			75		225	939	1 239
Total 97	1 846	32	0	0	137	45	423	1 209	1 158

1

Records covering the 1998 bathing season have been kept in respect of 1 829 bathing zones. The bathing zones are subdivided as follows, depending on their status level:

- (Ban = 1) bathing is prohibited for one of the zones under consideration;
- (NS = 0) there is no bathing zone that has 'not been sampled'; if this had been the case, the zone in question would be regarded as non-complying with the mandatory values laid down in the directive;
- (NC = 137) 137 bathing zones were not in compliance with the mandatory values laid down in the directive;
- (Freq = 45) 45 bathing zones were insufficiently sampled;
- (C (I) = 426) 426 bathing zones comply (only) with the mandatory values laid down in the directive;
- (C (G) = 1 220) 1 220 bathing zones comply with the mandatory and the (stricter) guideline values laid down in the directive.

The total number of zones complying with the mandatory values is thus 1 646 (426 + 1 220). It contains the 426 zones only complying with the mandatory values (C(I)) and the 1 220 zones that comply with the stricter guide values (C(G)) and thus logically had to comply first with mandatory values.

- (DEL = 32) 32 bathing zones have been withdrawn compared with the previous bathing season (1997).

2

For the 1997 bathing season, records have been kept for 1 846 bathing zones. The bathing zones were subdivided as follows, depending on their status level: (NC = 85; Freq = 185; C(I) = 327; C(G) = 1 249).

Some 15 new bathing zones were added during the 1998 bathing season.

3 and 4

Of the 15 new bathing zones, 1 is prohibited for bathing, 3 comply with the mandatory values and 11 comply with the guide values.

Regarding the 1 846 bathing zones accounted for during the 1997 bathing season, the following status was calculated for the 1998 bathing season: 32 have been withdrawn; 137 are not in compliance, 45 have been insufficiently sampled; 423 comply with the mandatory values; 1 209 comply with the guideline values.

5 and 6

Some 32 bathing zones have been withdrawn for the 1998 bathing season of which 6 were not in compliance, 12 were insufficiently sampled, 4 complied with the mandatory values; 10 complied with the guideline values during the 1997 bathing season.

The status of the 1 829 bathing zones accounted for in 1998 was as follows during the 1997 bathing season: 79 were not in compliance, 173 had been insufficiently sampled, 323 complied with the mandatory values, 1 239 complied with the guide values and 15 new bathing zones were added.

7

Of the 1 846 bathing zones accounted for during the 1997 bathing season, 1 158 zones — more than 62 % (1 158/1 846) — kept the same status in the 1998 bathing season. Looking at the different status levels, the following can be said: 19 were still not in compliance, 45 had still not been sufficiently sampled, 155 still complied with the mandatory values and 939 still complied with the guide values.

8

9

Of the 85 bathing zones that were not in compliance during the 1997 bathing season: 19 have not changed status; 6 have been withdrawn; 25 have come into compliance with the mandatory values; 35 have come into compliance with the guide values during the 1998 bathing season.

Of the 185 bathing zones that had been insufficiently sampled during the 1997 bathing season, 45 have not changed status, 12 have been withdrawn, 6 did not comply, 18 have come into compliance with the mandatory values and 104 have come into compliance with the guide values during the 1998 bathing season.

Of the 327 bathing zones complying with the mandatory values during the 1997 bathing season, 155 have not changed status, 4 have been withdrawn; 37 no longer complied and 131 have come into compliance with the guide values during the 1998 bathing season.

Of the 1 249 bathing zones complying with the guide values during the 1997 bathing season, 939 have not changed status; 10 have been withdrawn; 75 no longer complied and 225 only complied with the mandatory values during the 1998 bathing season.

Ratio = 0.91 (313/343)

In conclusion, it may be stated that the average status of bathing zones has deteriorated. Status levels have slipped slightly more towards the red zone than to the blue zone: 313 bathing zones also accounted for during the 1997 bathing season have a 'better' status during the 1998 bathing season, whereas 343 bathing zones have seen a negative quality status shift.

Stability index = 63.84 %

The stability index is $1158 / (656 + 1158) = 63.84 \%$. This is fairly low and can be attributed, *inter alia*, to the more precarious balance in freshwater zones due to their geographical location. Unfortunately, this stability index is coupled with a ratio below 1 which means that the average status of the bathing areas taken into account during the two bathing seasons has deteriorated.

Consequently, a fairly low stability index, coupled with a ratio below 1, suggests problems and certain imperfections with maintaining the quality of the bathing areas from one bathing season to the next.

C. Warning

Three Member States — France, Denmark and Finland — were still not measuring the 'total coliforms' microbiological parameter during the 1998 bathing season, despite the fact that the directive makes it mandatory to measure this parameter.

After the Commission started infringement procedures, both Denmark and Finland amended their national legislation at the end of 1998 and measured total coliforms for the first time during the 1999 bathing season. Consequently, this parameter is also taken into account for calculating the status of bathing areas in these two countries. Since this parameter was measured and, hence, included for the first time during the 1999 bathing season, this could possibly have produced slightly lower results without, however, signifying any real problem with the microbiological quality of these bathing areas.

**D. Maps and lists
of bathing areas in each
Member State**

1. Results

Table 1 — Results from 1992 to 2000

Σ : total number of bathing areas taken into account;

C(I) : percentage of sufficiently sampled bathing areas which comply with the mandatory values;

C(G) : percentage of sufficiently sampled bathing areas which comply with the mandatory values and the guide values;

NF : percentage of insufficiently sampled bathing areas;

NC : percentage of bathing areas not sampled (or no data available) or which do not comply with the mandatory values.

NB: percentage of points where bathing was prohibited for the duration of the bathing season.

These percentages relate to all bathing areas and to the 'total coliforms and faecal coliforms, mineral oils, surface-active substances and phenols' parameters.

Member States as a whole		Σ	C (I) (%)	C (G) (%)	NF (%)	NC (%)	NB (%)
Coastal zones	1992 ⁽¹⁾	10 972	84,9	73,5	4,8	9,9	0,4
	1993 ⁽¹⁾	11 361	73,9	65,7	19,0	6,9	0,2

	2000 ⁽⁴⁾	4 338	93,6	70,4	0,9	4,7	0,8

⁽¹⁾ Eleven Member States.

⁽²⁾ ⁽¹⁾ + two new Member States (Finland and Sweden).

⁽³⁾ ⁽²⁾ + Austria.

⁽⁴⁾ ⁽³⁾ except France.

Graphs — Results from 1992 to 2000

Pursuant to Article 13 of Directive 76/160/EEC, as amended by Article 3 of Directive 91/692/EEC, the Member States send the Commission an annual summary report on their bathing water and the most significant characteristics thereof. As with the 1999 bathing season, France submitted no results for the 2000 bathing season, either for coastal zones or for freshwater zones.

Table 1 sets out first the coastal zone results and then the freshwater zone results for the Member States as a whole (except France) from 1992 to 2000. The table and the associated graphs present the results using rates calculated on the basis of the two microbiological parameters ('total coliforms and faecal coliforms') and the three physical and chemical parameters ('mineral oils, surface-active substances and phenols'), for which the directive lays down minimum sampling frequencies and mandatory values not to be exceeded.

As in previous years, the results submitted by the Member States show consistent and significant improvement in the quality of bathing areas, both coastal and freshwater. Once again, the biggest improvement is in the quality of freshwater zones, which nonetheless continue to show lower rates of compliance with the standards laid down by the directive. The difference in quality between coastal and freshwater zones remains marked, though the gaps between the values recorded for any given parameter are gradually closing as the years pass. Only the percentage of insufficiently sampled bathing areas is identical for coastal and freshwater zones.

2. Number of recorded bathing areas (coastal: 11 502; freshwater: 4 338)

The total number of coastal zone bathing areas taken into account for the 2000 bathing season is 11 502, a rise of 67 compared with the previous bathing season. As for the freshwater zones, the total number of bathing areas for the Member States as a whole has fallen for the third season running; it is down 38 to 4 338 for the 2000 bathing season. It is unfortunate that certain Member States (Greece, Ireland, United Kingdom) take only a very small number of freshwater bathing areas into account.

3. Comments

It is regrettable that, despite significant efforts during the 2000 bathing season (particularly in freshwater zones), several Member States are still not observing the prescribed sampling frequencies when monitoring their bathing areas, either in coastal zones or in freshwater zones. This is particularly remiss, as the sampling frequency is clearly defined for each bathing area and is not open to interpretation.

Quality of coastal zones (2000 bathing season)

The results cover all the Member States except France, which submitted no results for the 2000 bathing season, and Austria and Luxembourg, which have no coastal zones.

All the measured parameters, except the percentage of insufficiently sampled bathing areas, show an improvement in the quality of bathing water compared with the 1999 bathing season, and, on average, the Member States as a whole are continuing to report coastal zone bathing areas of high quality. The percentage of bathing area compliance with the mandatory values is particularly high, at over 96 %, while almost 89 % of bathing areas comply with the stricter guide values.

The rates of compliance with the mandatory and guide values are thus fairly good, and have been rising consistently since the 1993 bathing season. Compared with the previous bathing season, the rate is up from 95.6 to 96.5 % for the mandatory values and from 87.3 to 88.4 % for the guide values. Logically enough, the percentage of bathing areas not complying with the mandatory values has fallen, from 3.5 % for the 1999 bathing season to 2.5 % for the 2000 bathing season. The percentage of bathing areas closed to bathing has also fallen slightly, from 0.2 % in 1999 to 0.1 % in 2000. Only the percentage of insufficiently sampled bathing areas has risen slightly to 0.9 % (0.6 % during the previous bathing season).

The pattern of results since 1992 is striking. Most of the measured parameters have improved consistently since the 1993 bathing season, despite the addition of two new Member States in 1995 (Finland and Sweden) and a regular increase in the number of bathing areas whose quality is monitored. The percentage of bathing areas closed to bathing fluctuates very slightly from one bathing season to the next, but not to any significant extent.

Quality of freshwater zones (2000 bathing season)

The results cover all the Member States except France, which submitted no results for the 2000 bathing season.

As with the coastal zones, but more markedly, all the measured parameters show an improvement in bathing water quality compared with the 1999 bathing season. Logically enough, this improvement is greater than for the coastal zones, as the figures submitted for certain parameters remain relatively low. The percentages of bathing areas complying with the guide values (70.4 %) and/or the mandatory values (93.6 %) have risen by 3.5 and 3.4 % respectively compared with the 1999 bathing season. The percentage of bathing areas not complying with the mandatory values has fallen by a smaller amount, from 5.4 % in 1999 to 4.7 % in 2000. The percentage of insufficiently sampled bathing areas is well down, from 3.2 % in the 1999 bathing season to 0.9 % in the 2000 bathing season. Lastly, the percentage of bathing areas closed to bathing has fallen by 0.3 %, reaching 0.8 % for the 2000 bathing season.

Far more than is the case with coastal zones, major differences exist in the quality of freshwater bathing areas from one Member State to another (appropriate measures need to be taken in many cases). Nonetheless, the results submitted for freshwater zones are, over the years, gradually coming closer to those submitted for coastal zones. Though the difference between coastal and freshwater zones in terms of the percentage of bathing area compliance with the mandatory values laid down by the directive is less than 3 %, the difference between the percentages of bathing area compliance with the stricter guide values is still considerable (18 %).

It will be seen, however — and this is particularly encouraging — that, as for the coastal zones, the average quality of freshwater zones in the Member States as a whole has risen constantly since 1993, and that this trend has continued into the 2000 bathing season.

4. Analysis of changes

Table 2 — Cross-reference tables (1999 and 2000 bathing seasons)

Coastal zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		119	14	4	289	99	929	10 167	11 502
NEW	186	0	0	0	9	9	20	148	186
Ban	14	1	12	0	0	0	1	0	13
NS	3	0	0	3	0	0	0	0	3
NC	407	9	1	0	111	4	106	176	398
Freq	71	13	0	0	0	21	3	34	58
C (I)	959	28	1	0	72	0	425	433	931
C (G)	9 981	68	0	1	97	65	374	9 376	9 913
Tot. 99	11 435	119	14	4	280	90	909	10 019	9 948

Coastal zones: (ratio = 1.23/stability = 87.9 %)

As was the case for the 1999 bathing season, the ratio is just above 1 for the 2000 bathing season. This indicates that the changes which occurred — on average, for 12 Member States (Austria and Luxembourg have no coastal zones; France submitted no results) — between the 1999 and 2000 bathing seasons resulted in a slight improvement in the average quality of coastal zone bathing areas.

The stability index of 87.9 % is slightly higher than for the 1999 bathing season. It shows that only 12.1 % of the bathing areas taken into account during the 1999 bathing season and again during the 2000 bathing season saw their status change from one season to the next. That seems to suggest (given a ratio just over 1) that maintaining the quality of bathing areas from one bathing season to the next is not generally posing too many problems and, in any event, that the quality of coastal zone bathing areas is more easily maintained than that of freshwater zone bathing areas.

It must also be underlined that 99 bathing areas are still insufficiently sampled. This is more than during the previous bathing season, despite warnings having been given. It is particularly regrettable in that the sampling frequency is clearly defined for each bathing area and is not open to interpretation. It is unacceptable, then, that not only have bathing areas insufficiently sampled during the previous bathing season remained insufficiently sampled, but that, in addition, bathing areas which were properly sampled during the 1999 bathing season were insufficiently sampled during the 2000 season.

Freshwater zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		116	35	2	200	40	1 005	3 056	4 338
NEW	78	0	0	0	2	2	24	50	78
Ban	47	7	14	0	6	0	6	14	40
NS	5	0	0	1	1	0	3	0	5
NC	235	14	6	0	49	1	85	80	221
Freq	141	15	2	0	2	15	16	91	126
C (I)	1 020	30	4	0	86	4	506	390	990
C (G)	2 928	50	9	1	54	18	365	2 431	2 878
Tot. 99	4 376	116	35	2	198	38	981	3 006	3 016

Freshwater zones: (ratio = 1.26/stability = 70.8 %)

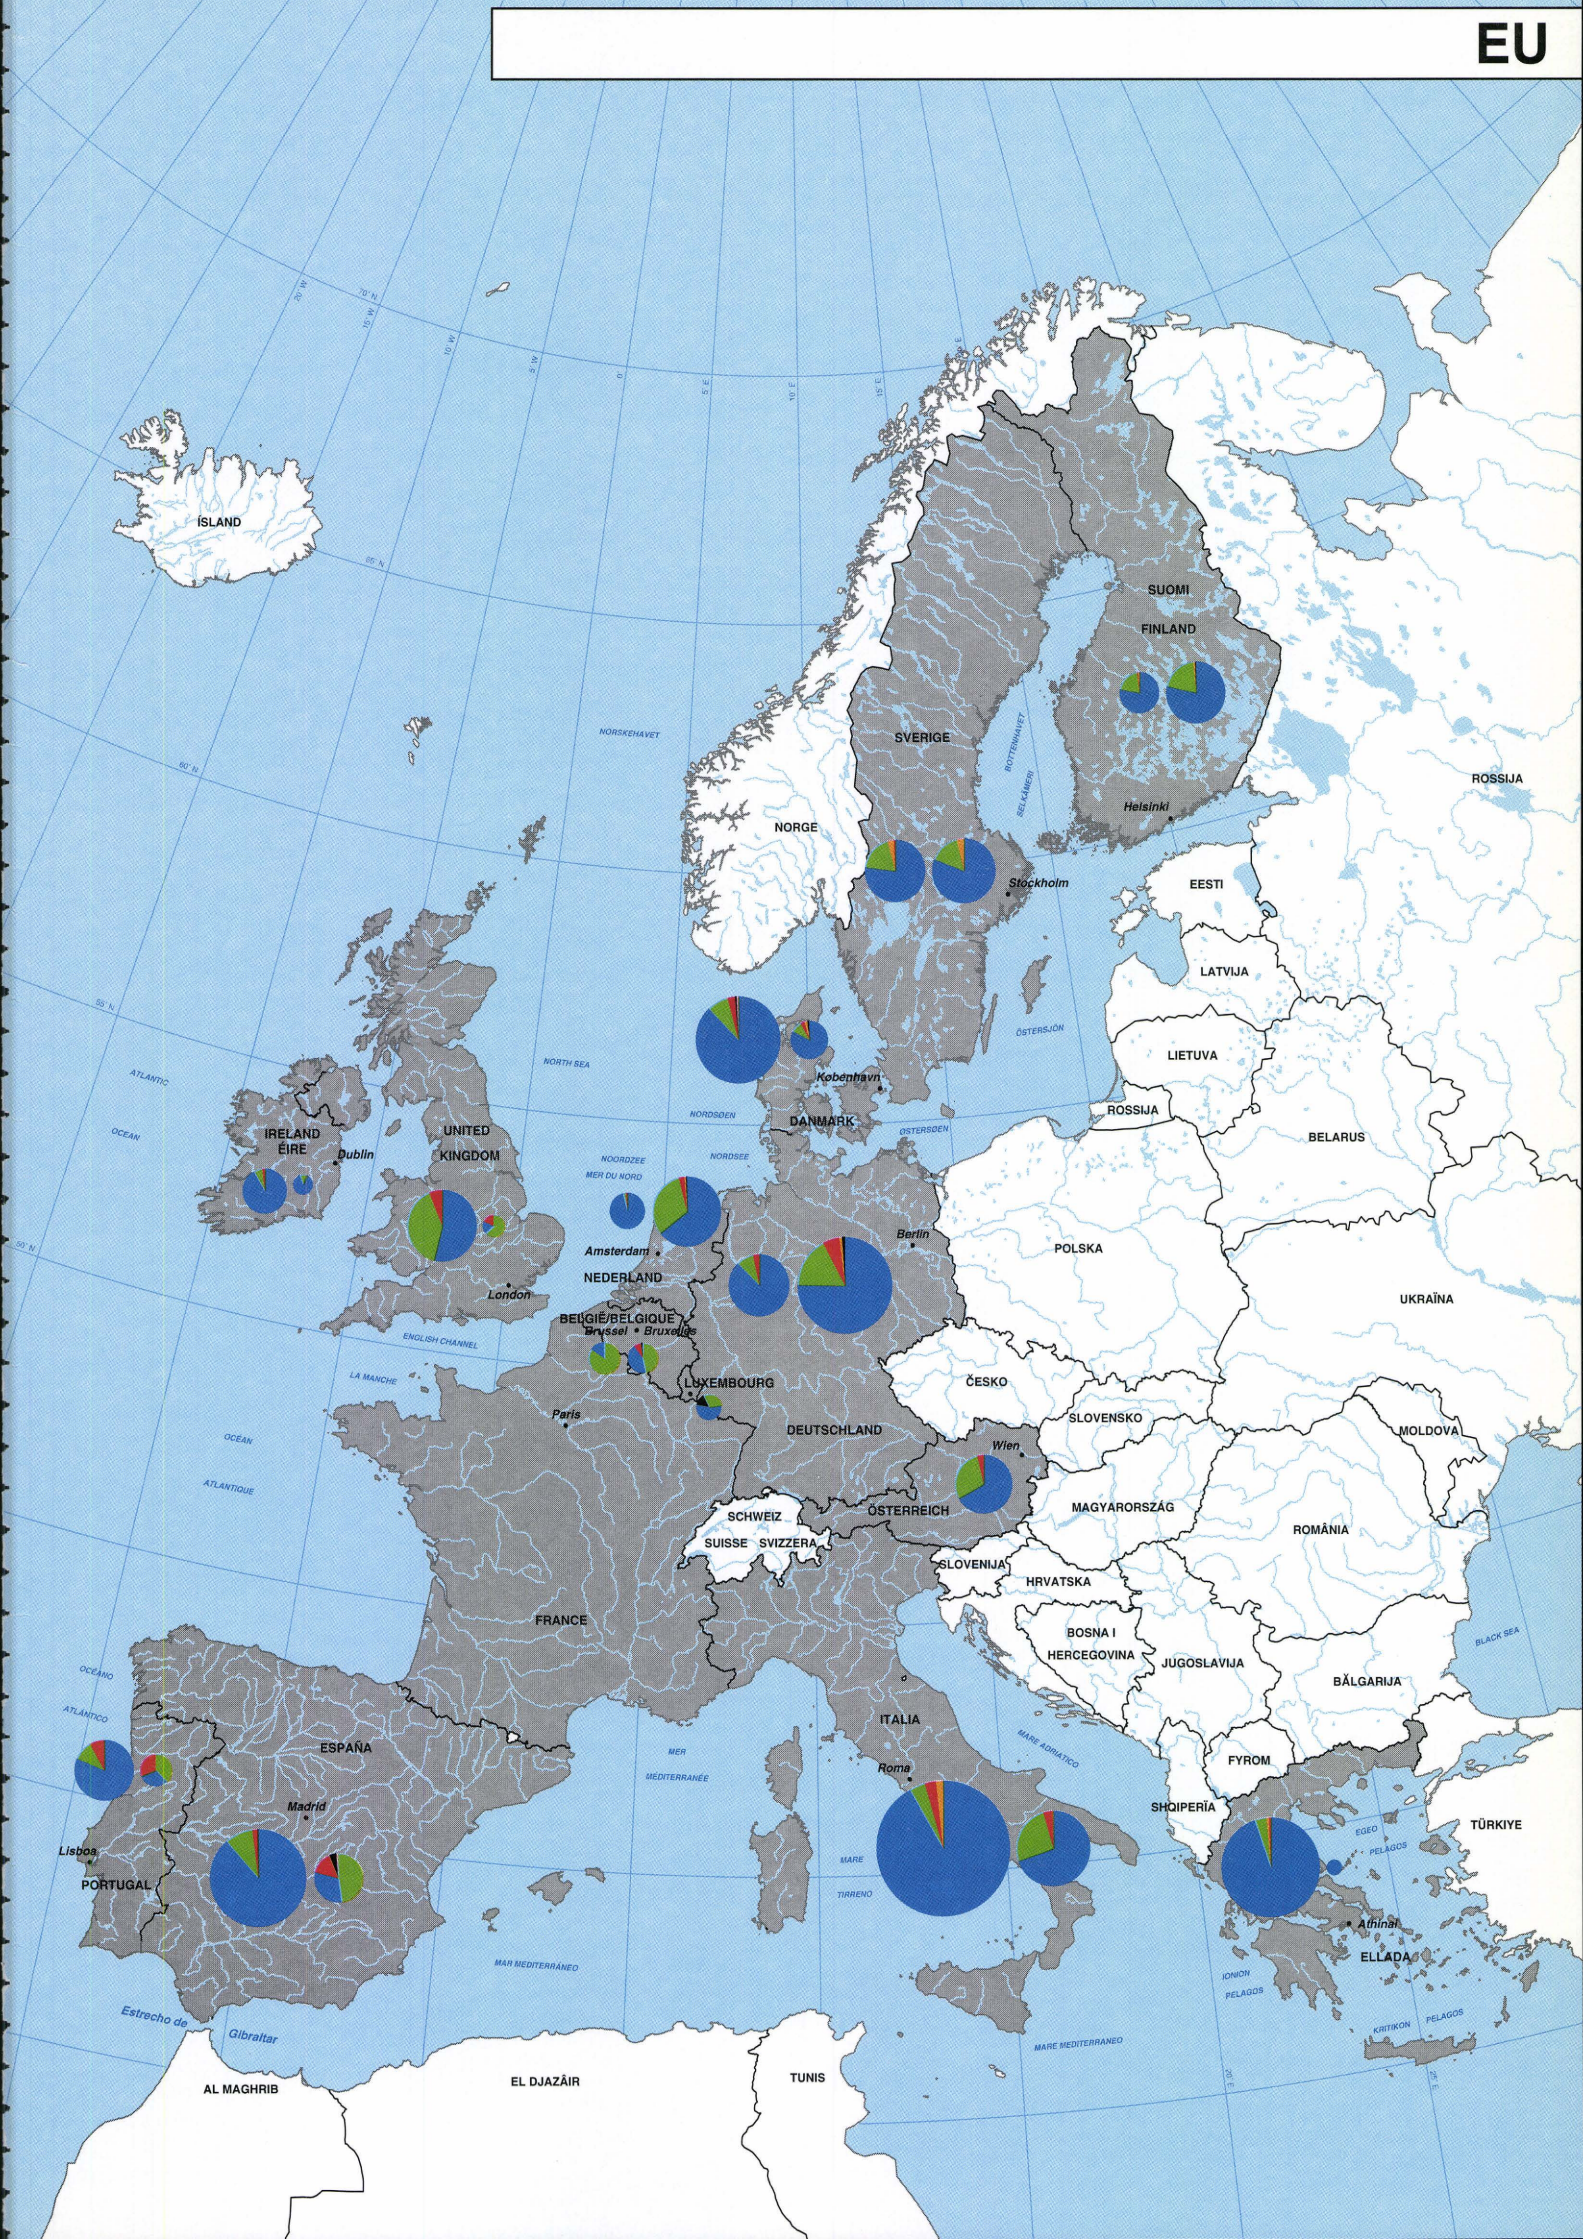

As with the coastal zones, and as was the case for the previous bathing season, the ratio is just above 1. This shows that the changes which occurred — on average, for 14 Member States (France submitted no results for the 1999 or 2000 bathing seasons) — between the 1999 and 2000 bathing seasons resulted in a slight improvement in the average quality of freshwater zone bathing areas.

The stability index for freshwater zones is much lower than the index for coastal zones. This seems to suggest that it is more difficult to maintain the quality of freshwater zone bathing areas from one bathing season to the next. Fortunately, the ratio greater than 1 indicates that these changes, though numerous, have for the most part been positive. Only 70.8 % of the bathing areas have retained their status of the previous bathing season. This is a very slight improvement over the previous season (70.2 %), and may therefore be seen as a sign of progress.

With regard to sampling frequency, the same remark may be made as for the coastal zones, though it is true that a clear improvement is observed compared with the previous bathing season. It is quite unacceptable for sampling frequencies not to be complied with in all cases when monitoring the quality of bathing areas.

Figure 1 — Evolution of the results from 1992 to 2000

3. Number of bathing areas (coastal: 39; freshwater: 51)

The number of coastal bathing areas taken into account in the 2000 bathing season has not changed since the previous season. In freshwater bathing areas, the number of areas taken into account has fallen continuously from 87 in 1995 to 51 in the 2000 bathing season, though one withdrawal came about as the result of two neighbouring areas being merged.

4. Comments

The average quality of the coastal bathing areas is very much the same as was observed in the 1999 bathing season, although the number of bathing areas complying with the guide values rose very slightly during the 2000 bathing season. However, as in the 1999 bathing season, the average quality of freshwater bathing areas deteriorated significantly in the 2000 bathing season. Belgium is the only Member State whose coastal bathing areas comply 100 % with the mandatory values laid down by the directive (1997, 1999 and 2000 bathing seasons).

As in the previous bathing season, all coastal bathing areas comply with the mandatory values. The percentage of bathing areas complying with the stricter guide values rose slightly from 12.8 % in the previous bathing season to 15.4 % in the 2000 bathing season, but is still abnormally low. There were no areas where bathing was prohibited and all the bathing areas were sampled sufficiently.

In the freshwater zones, all the indicators are therefore again falling. The percentage of bathing areas complying with the mandatory values fell by 2.1 % (to 90.2 % in the 2000 bathing season) and the percentage complying with the guide values, which was already low in the 1999 bathing season, fell by 8.8 % (to 43.1 % in the 2000 bathing season) compared with the previous season. For the 2000 bathing season, the percentage of bathing areas which fail to comply is very slightly up, from 7.7 to 7.8 %, compared with the previous bathing season. Bathing was prohibited in one bathing area and all the bathing areas were sufficiently sampled.

5. General information ⁽¹⁾

Public information

The Flemish Region published booklets relating to water quality, one on the Belgian coast and one about ponds. These booklets were distributed via doctors, district councils, tourist information offices and the persons responsible for bathing ponds. During the summer months, news bulletins dealing with bathing water quality are broadcasted via radio and television. Information is also posted at the bathing spots. The press is informed each week of the quality of all the bathing areas (certain newspapers devote special attention to it). Information is also distributed via Teletext and on the Internet.

Wastewater treatment

Following the great effort, which has been devoted in recent years to the construction of the infrastructure for wastewater treatment along the Belgian coast, the scheme is for the most part completed. Additional investments (limited and targeted) will make it possible to further improve the quality of coastal bathing waters. In the Walloon Region, authorities drew up an investment plan over four years, which was planned to begin in 1996.

6. Infringement procedure

On 25 May 2000, the Court of Justice ruled that bathing water in Belgium had failed to comply. As the Belgian authorities have not taken any measures to comply with the Court's judgment, the Commission has sent a letter of formal notice as provided for in Article 228 of the Treaty.

⁽¹⁾ The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

7. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Coastal zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		0	0	0	0	0	33	6	39
NEW	0								0
Ban	0								
NS	0								0
NC	0								0
Freq	0								0
C (I)	34						33	1	34
C (G)	5							5	5
Tot. 99	39	0	0	0	0	0	33	6	38

Coastal zones (ratio = irrelevant; stability = 97.4 %)

No figure can be given for the ratio, as the only observed change was the improvement in quality of a bathing area which already complied with the mandatory values during the 1999 bathing season and which achieved compliance with the stricter guide values during the 2000 bathing season. No downward trend was observed.

Logically enough, the stability index is particularly high here. It reflects a situation almost unchanged since the previous bathing season, particularly as no bathing areas were added or withdrawn during the 2000 bathing season.

Freshwater zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		1	1	0	4	0	24	22	51
NEW	0								0
Ban	0								
NS	0								0
NC	4				1		3		4
Freq	0								0
C (I)	21		1		3		13	4	21
C (G)	27	1					8	18	26
Tot. 99	52	1	1	0	4	0	24	22	32

Freshwater zones (ratio = 0.58; stability = 62.7 %)

The ratio of 0.58 confirms a further deterioration in the average quality of freshwater zones during the 2000 bathing season. Moreover (and this is not taken into account in the ratio), one bathing area which complied with the guide values was withdrawn during the 2000 bathing season. This deterioration is borne out by the rather low stability index; 37.3 % of bathing areas saw their status change compared with the previous bathing season, and, as the ratio indicates, most of these changes pushed down the average quality of freshwater zones.

Almost 30 % of the bathing areas which complied with the guide values during the 1999 bathing season have slipped to compliance only with the mandatory values; also, while four bathing areas which complied with the mandatory values in 1999 also attained compliance with the stricter guide values during the 2000 bathing season, an equal number of bathing areas which had complied with the mandatory values no longer complied or were closed to bathing (one bathing area).

Though it does little to offset the poor overall results for freshwater zones, one positive trend is discernible: three of the four bathing areas which failed to comply with the mandatory values during the 1999 bathing season achieved compliance during the 2000 bathing season.

Figure 1 — Evolution of the results from 1992 to 2000

3. Number of bathing areas (coastal: 1 161; freshwater: 115)

As in the 1999 bathing season, a large number (30) of coastal bathing areas were withdrawn (since they were no longer used for bathing) and 14 new bathing areas were taken into account. One freshwater bathing area was withdrawn and two new bathing areas taken into account during the 2000 bathing season.

4. Comments

There has been an improvement compared with the previous bathing season for both coastal and freshwater zones. However, as pointed out for the 1999 bathing season, insufficient sampling was carried out in both coastal (0.4 %) and freshwater (2.6 %) bathing areas. This is a particularly negative point since the sampling frequency is clearly defined for each bathing area and is not open to interpretation.

For the coastal zones, the improvement is quite marked, with an increase of 3.1 % in the number of bathing areas complying with the mandatory values and an increase of 6.9 % in the number complying with the stricter guide values, bringing the figures to 95.8 and 87.7 % respectively. This was accompanied by a sharp fall in the percentage of bathing areas not complying with the mandatory values from 5.9 % in the previous bathing season to 2.8 %.

The percentage of freshwater bathing areas not complying with the mandatory values remained the same (3.5 %) as in the 2000 bathing season. The percentage of areas complying with the mandatory values rose very slightly (by 1 %) compared with the previous season to 92.2 %, while the percentage complying with the stricter guide values rose more markedly (by 2.8 %) to 82.6 % in the 2000 bathing season.

5. General information (1)

Public information

Data on the quality of bathing waters will be available on the Internet in 2001 (2001 bathing season).

Wastewater treatment

In 1987, the Danish Parliament consented to the introduction of a national action plan for water. Today, all purification plants with a population equivalent of more than 5 000 have tertiary treatment, and redistribution of the treated water, in the normal manner, no longer adversely affects the quality of bathing water. Most industrial wastewater goes to the public treatment plants which carry out tertiary treatment. Only a small amount of industrial wastewater is still discharged directly into the environment and there is therefore no impact on the quality of bathing water.

In 1997, a new action plan worth DKK 7–12 billion was adopted. It includes the treatment of wastewater from rural infrastructures, which will now be connected up to public wastewater treatment plants. About 40 % of rural dwellings should therefore be connected to these treatment plants. The action plan should therefore help to improve the general quality of both coastal and freshwater zones and hence the quality of bathing water.

6. Infringement procedure

The Commission has decided to start proceedings against Denmark before the Court of Justice in Luxembourg for insufficient sampling and poor application of the directive.

(1) The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

7. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Coastal zones (TC, FC, MO, SA, PHE)									
	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		30	11	0	33	5	94	1 018	1 161
NEW	14					3	1	10	14
Ban	11	1	10						10
NS	0								0
NC	70	1	1		4	2	11	51	69
Freq	5	1					1	3	4
C (I)	140	7			11		27	95	133
C (G)	951	20			18		54	859	931
Tot. 99	1 177	30	11	0	33	2	93	1 008	900

Coastal zones (ratio = 1.94; stability = 78.5 %)

The ratio is well above 1, having been below 1 for the previous two bathing seasons. This reflects an appreciable improvement in the average quality of bathing areas since the 1999 bathing season. The stability index is somewhat low (considering that stability from one bathing season to another seems more easily achievable in coastal zones), but in conjunction with a ratio well above 1 it underlines the positive trend observed for the 2000 bathing season.

Indeed, almost 90 % of the bathing areas which failed to comply with the mandatory values during the 1999 bathing season achieved compliance with the mandatory values or (in greater numbers) with the stricter guide values. Similarly, almost 70 % of the bathing areas which complied only with the mandatory values also achieved compliance with the guide values.

In all, 30 bathing areas were withdrawn, most of which complied with the mandatory values or the stricter guide values.

Freshwater zones (TC, FC, MO, SA, PHE)									
	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		1	2	0	4	3	11	95	115
NEW	2				1		1		2
Ban	0								0
NS	0								0
NC	4				2			2	4
Freq	6		2			3		1	6
C (I)	13						5	8	13
C (G)	91	1			1		5	84	90
Tot. 99	114	1	2	0	3	3	10	95	94

Freshwater zones (ratio = 1.83; stability = 83.2 %)

A situation similar to that for coastal zones, but with a fairly high stability index. The ratio is well above 1, indicating that the average quality of freshwater zones has improved since the 1999 bathing season.

Two of the four bathing areas which had not complied with the mandatory values, and 8 of the 13 bathing areas which only complied with the mandatory values, achieved compliance with the stricter guide values.

Conversely, only seven bathing areas which had complied with the guide values lost that status during the 2000 bathing season, most of them still complying with the less strict mandatory values (one bathing area failed to comply with the mandatory values; another was withdrawn).

1. 2000 bathing season

3 to 4 months depending on the geographical location, but in general from 1 June to 15 September

2. Main results

Table 1 — Evolution of the results from 1992 to 2000

Σ : total number of bathing areas;

C (I) : percentage of bathing areas sufficiently sampled which comply with mandatory values;

C (G) : percentage of bathing areas sufficiently sampled which comply with guide values;

NF : percentage of bathing areas insufficiently sampled;

NC : percentage of bathing areas which do not comply with mandatory values or which are not sampled (or no data available);

NB : percentage of points where bathing was prohibited for the duration of the bathing season.

Parameters for which compliance is calculated: total coliforms, faecal coliforms, mineral oils, surface-active substances and phenols.

Germany		Σ	C (I) (%)	C (G) (%)	NF (%)	NC (%)	NB (%)
Coastal zones	1992	438	42,7	29,7	30,4	23,5	3,4
	1993	435	73,6	59,1	9,0	16,3	1,1
	1994	442	78,1	57,0	6,8	14,7	0,4

	2000	1 615	92,3	75,4	0,9	5,8	1,0

Figure 1 — Evolution of the results from 1992 to 2000

3. Number of bathing areas (coastal: 411; freshwater: 1 615)

The situation in the coastal zones in the 2000 bathing season was similar to the previous season, with four bathing areas withdrawn and one new bathing area taken into account. In the freshwater zones, 35 bathing areas were withdrawn compared with the 1999 bathing season and 11 new areas were added. The total number of bathing areas taken into account fell again during the 2000 bathing season.

4. Comments

Compared with the previous bathing season, there was an improvement in the average quality of bathing areas in the coastal zones and, to a lesser extent, in the freshwater zones. However, some freshwater bathing areas are still being insufficiently sampled. This is a particularly negative point since the sampling frequency is clearly defined for each bathing area and is not open to interpretation.

In the coastal zones, the percentages of bathing areas complying with the guide values (87.6 % in the 2000 bathing season) and/or the mandatory values (96.8 % in the 2000 season) rose by 5 and 3.3 % respectively compared with the previous bathing season. Obviously, therefore, the percentage of bathing areas not complying with the mandatory values fell by 3.1 %, from 6.3 % in the previous bathing season to 3.2 % in 2000. There were no longer any areas where bathing was prohibited and no bathing zone was insufficiently sampled.

In the freshwater zones, although the average quality of bathing areas is increasing, there are more nuances. Although the percentage of bathing areas complying with the guide values rose sharply — from 69.9 % in the previous bathing season to 75.4 % in 2000 — there was a very slight fall (of 0.1 %) in the percentage of bathing areas which only complied with the less strict mandatory values (92.3 %) in 2000. Conversely, while the percentage of areas in which bathing was prohibited (1 %) rose very slightly (by 0.1 %) compared with the previous bathing season, the percentage of areas not complying with the mandatory values (5.8 %) fell by the same proportion during the 2000 season. Deplorably, the number of areas insufficiently sampled and the number in which no sampling was carried out both increased very slightly, the percentages being 0.9 and 0.06 % respectively in 2000.

5. General information (¹)

Public information

Seaside resorts, in particular, inform their visitors by means of posters or other relevant material about their bathing water quality. Similarly, the media regularly communicate the most recent results to citizens. Several *Länder* publish reports on their bathing water quality, which can sometimes also be found on the Internet.

Wastewater treatment

The competent administrations of the *Länder* have carried out investigations to detect the causes of repeated breaches of the standards of the directive. These investigations have led to improvement and/or prevention measures for the zones affected.

6. Infringement procedure

On 9 June 1999, the Court of Justice ruled that bathing water in Germany had failed to comply and had been insufficiently sampled. As the German authorities have not taken any measures to comply with the Court's judgment, the Commission has sent a letter of formal notice as provided for in Article 228 of the Treaty.

(¹) The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

7. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Coastal zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		4	0	0	13	0	38	360	411
NEW	1							1	1
Ban	1						1		1
NS	0								0
NC	26				4		5	17	26
Freq	0								0
C (I)	45	1			2		12	30	44
C (G)	342	3			7		20	312	339
Tot. 99	414	4	0	0	13	0	38	359	328

Coastal zones (ratio = 1.8; stability = 80 %)

The ratio of 1.8 indicates a rise in the average quality of bathing areas for the 2000 bathing season. However, the stability index is rather low (20 % of bathing areas saw their status change compared with the previous bathing season) and appears to suggest some difficulty in maintaining the quality of coastal zones from one bathing season to the next (even though it generally seems easier to maintain the quality of coastal zones). However, this needs to be set alongside the fact that the ratio is greater than 1.

Almost all the bathing areas which failed to comply with the mandatory values during the 1999 bathing season achieved compliance with the guide and/or mandatory values during the 2000 season. At the same time, over 65 % of the bathing areas complying with the mandatory values also achieved compliance with the stricter guide values. This latter trend is partly offset by an equivalent proportion of bathing areas which complied with the guide values during the 1999 season slipping during the 2000 season to compliance only with the mandatory values (the majority) or to non-compliance.

The bathing area closed to bathing was reopened during the 2000 bathing season, and complied with the mandatory values.

Freshwater zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		35	16	1	94	14	273	1 217	1 615
NEW	11						3	8	11
Ban	15	1	3		1			10	14
NS	0								0
NC	97	4	4		19		28	42	93
Freq	13	4			1	2	1	5	9
C (I)	373	11	2		38	1	133	188	362
C (G)	1 141	15	7	1	35	11	108	964	1 126
Tot. 99	1 639	35	16	1	94	14	270	1 209	1 121

Freshwater zones (ratio = 1.35; stability = 69.9 %)

The ratio of 1.35 shows a slight improvement in the average quality of freshwater zones during the 2000 bathing season. The stability index is fairly low, as over 30 % of bathing areas underwent a change of status from one bathing season to the next.

The changes which occurred from one bathing season to the next were many and erratic. For instance, while 70 bathing areas which failed to comply with the mandatory values during the 1999 bathing season achieved compliance with the mandatory (the majority) or guide values during the 2000 season, a slightly greater number of bathing areas which did comply with the guide and/or mandatory values slipped (in equal numbers) to non-compliance.

The good news — reflecting the most significant improvement — is that 245 bathing areas which did not comply with the guide values during the 1999 bathing season did comply in the 2000 season, while only 162 bathing areas lost that status, slipping to compliance with the mandatory values (the majority), non-compliance, insufficient or no sampling, or bathing prohibition.

1. 2000 bathing season

5 to 6 months depending on the geographical location, but in general from 15 May to 31 October

2. Main results

Table 1 — Evolution of the results from 1992 to 2000

Σ : total number of bathing areas;

C (I) : percentage of bathing areas sufficiently sampled which comply with mandatory values;

C (G) : percentage of bathing areas sufficiently sampled which comply with guide values;

NF : percentage of bathing areas insufficiently sampled;

NC : percentage of bathing areas which do not comply with mandatory values or which are not sampled (or no data available);

NB : percentage of points where bathing was prohibited for the duration of the bathing season.

Parameters for which compliance is calculated: total coliforms, faecal coliforms, mineral oils surface-active substances, and phenols.

Greece		Σ	C (I) (%)	C (G) (%)	NF (%)	NC (%)	NB (%)
Coastal zones	1992	1 203	96,3	94,5	0,7	3,1	0,0
	1993	1 250	95,8	93,5	0,8	3,4	0,0
	1994	1 281	94,7	90,9	1,8	3,5	0,0
	1995	1 526	97,9	95,5	0,5	1,6	0,0
	1996	1 690	98,6	95,8	0,2	1,2	0,0
	1997	1 701	98,4	95,0	0,2	1,4	0,0
	1998	1 733	98,7	96,1	0,3	1,0	0,0
	1999	1 816	98,9	95,8	0,2	0,9	0,0
	2000	1 858	98,8	95,0	0,4	0,9	0,0
Freshwater zones	1992	4	100,0	75,0	0,0	0,0	0,0
	1993	4	100,0	50,0	0,0	0,0	0,0
	1994	4	100,0	25,0	0,0	0,0	0,0
	1995	4	75,0	50,0	0,0	25,0	0,0
	1996	4	75,0	25,0	0,0	25,0	0,0

	1998	4	100,0	75,0	0,0	0,0	0,0
	1999	4	100,0	25,0	0,0	0,0	0,0
	2000	4	100,0	100,0	0,0	0,0	0,0

Figure 1 — Evolution of the results from 1992 to 2000

3. Number of bathing areas (coastal: 1 858; freshwater: 4)

No coastal bathing areas were withdrawn, but 42 new bathing areas were taken into account during the 2000 bathing season. In the freshwater areas, the situation has remained unchanged since the 1994 bathing season with only four bathing areas taken into account, an extremely small number.

4. Comments

In the coastal areas, the results remained very good, although there was a very small drop in the percentage of bathing areas complying with the guide values and sampling frequencies. With regard to the latter, as pointed out in the previous report, it is unacceptable that bathing areas are still insufficiently sampled since the sampling frequency is clearly defined for each bathing area and is not open to interpretation. In the freshwater areas, there was a marked improvement in the average quality of bathing areas, but it is regrettable that the results submitted cover only four bathing areas.

The results remained excellent in the coastal zones. The percentage of bathing areas complying with the mandatory values was exactly the same as during the previous bathing season: 98.8 %. Although the percentage of bathing areas complying with the stricter guide values fell slightly during the 2000 bathing season, it was still 95 %, a particularly high figure. The percentage of bathing areas not complying with the mandatory values fell by 0.2 %, from 1.0 % in the 1999 bathing season to 0.8 %, while the percentage of bathing areas insufficiently sampled increased very slightly, from 0.2 to 0.4 % in the 2000 bathing season. There were no areas where bathing was prohibited.

With four freshwater bathing areas taken into account, the analysis is simple. During the 2000 bathing season, all four bathing areas were in compliance with the mandatory values as well as the stricter guide values.

5. General information (1)

Wastewater treatment

A large number of wastewater treatment plants are under construction in Greece to implement Directive 91/271/EEC concerning urban wastewater treatment. Six cities have a population equivalent of more than 150 000 inhabitants: Athens, Thessaloniki, Iraklio, Elefsina-Aspropyrgos, Metamorphosis and Patras. Athens and Thessaloniki alone have a population equivalent of more than 4 million, which is practically equivalent to half the country's population. Since 1998, Iraklio and Metamorphosis have had secondary treatment units. Athens has only primary treatment, but work recently started to add biological treatment. Thessaloniki has one secondary treatment plant in operation which includes the treatment of nitrogen. The wastewater treatment plant in Patras should become operational in 2001.

(1) The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

6. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Coastal zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		0	0	0	16	7	70	1 765	1 858
NEW	42						1	41	42
Ban	0								
NS	0								0
NC	17				7		4	6	17
Freq	4							4	4
C (I)	55				4		24	27	55
C (G)	1 740				5	7	41	1 687	1 740
Tot. 99	1 816	0	0	0	16	7	69	1 724	1 718

Coastal zones (ratio = 0.7; stability = 94.6 %)

A ratio of 0.7 would appear to reflect a fall in the average quality of bathing water compared with the 1999 bathing season. However, the figure needs to be seen in the specific Greek context.

- We need to allow for the large number of bathing areas taken into account. This is where the stability index comes in; the index is high, indicating that the vast majority of bathing areas have retained the status they had during the previous bathing season. The fall in quality therefore occurred only in a fairly small number of bathing areas, which lessens its impact.
- The ratio figure does not allow for the 42 new bathing areas taken into account, all but one of which complied with the guide values (the other complied only with the less strict mandatory values).

The cross-reference table shows, nonetheless, that some 3 % of the bathing areas which complied with the guide values during the previous bathing season lost that status, slipping to compliance with the less strict mandatory values (in most cases), insufficient sampling or non-compliance with the mandatory values. This is not counterbalanced by the bathing areas which went the other way, i.e. which previously had not complied with the mandatory values (six bathing areas), were insufficiently sampled (four bathing areas) or had complied only with the mandatory values (27 bathing areas), but which achieved compliance with the stricter guide values during the 2000 bathing season.

Freshwater zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		0	0	0	0	0	0	4	4
NEW	0								0
Ban	0								
NS	0								0
NC	0								0
Freq	0								
C (I)	3							3	3
C (G)	1							1	1
Tot. 99	4	0	0	0	0	0	0	4	1

Freshwater zones (ratio = irrelevant; stability = irrelevant)

Neither the ratio (all changes in status are upwards) nor the stability index are of any real interest, given the tiny number of bathing areas involved.

The results are excellent, as all four bathing areas comply not only with the mandatory values, but also with the stricter guide values (the three bathing areas which only complied with the mandatory values during the previous bathing season also achieved compliance with the guide values during the 2000 bathing season).

1. 2000 bathing season

The length of the bathing season is determined separately by each autonomous community. The average periods notified to the Commission are as follows:

Mainland: 15 April to 23 October
 Canary Islands: the whole year

2. Main results

Table 1 — Evolution of the results from 1992 to 2000

Σ : total number of bathing areas;

C (I) : percentage of bathing areas sufficiently sampled which comply with mandatory values;

C (G): percentage of bathing areas sufficiently sampled which comply with guide values;

NF : percentage of bathing areas insufficiently sampled;

NC : percentage of bathing areas which do not comply with mandatory values or which are not sampled (or no data available);

NB : percentage of points where bathing was prohibited for the duration of the bathing season.

Parameters for which compliance is calculated: total coliforms, faecal coliforms, mineral oils, surface-active substances, and phenols.

Spain		Σ	C (I) (%)	C (G) (%)	NF (%)	NC (%)	NB (%)
Coastal zones	1992	1 335	92,7	73,3	0,0	7,3	0,0

	2000	202	79,2	31,2	1,0	14,9	5,0

Figure 1 — Evolution of the results from 1992 to 2000

3. Number of bathing areas (coastal: 1 633; freshwater: 202)

In the coastal zones, 5 bathing areas were withdrawn compared with the previous bathing season and 14 new areas were added. The number of freshwater bathing areas was again reduced, with 14 bathing areas withdrawn and 3 new bathing areas added for the 2000 bathing season.

4. Comments

As in the previous bathing season, the average quality of the coastal bathing areas monitored is increasing. There was no significant improvement for the freshwater zones and the results are still quite mediocre. Some bathing areas were again sampled insufficiently or not at all. This is unacceptable since the sampling frequency is clearly defined for each bathing area and is not open to interpretation. Spain is the only Member State which still has bathing areas which are not sampled and therefore do not comply with the mandatory values.

In the coastal zones, the percentages of bathing areas complying with the guide values (88.7 %) and/or mandatory values (98.1 %) were up slightly by 1.0 and 0.3 % respectively compared with the previous bathing season. The percentage of bathing areas not complying with the mandatory values (1.5 %) fell by 0.4 %. Only the number of bathing areas in which bathing was prohibited rose very slightly to three for the 2000 bathing season. Four bathing areas were not sampled and are therefore considered not to comply with the mandatory values.

In the freshwater zones, trends were again variable but the results were generally mediocre. There was a slight drop in the percentage of bathing areas complying with the guide values, which was already extremely low in the 1999 bathing season. In the 2000 bathing season, the figure fell from 31.9 to 31.2 %. The only indicators showing any improvement were the percentage of bathing areas complying with the mandatory values (79.2 %), which was up 2.7 % compared with the previous bathing season and, more significantly, the percentage of bathing areas where bathing was prohibited fell from 9.9 to 5 % in the 2000 bathing season. The percentage of bathing areas failing to comply with the mandatory values rose by 3.6 % compared with the previous bathing season and is particularly high (14.4 %). One bathing area was not sampled and is therefore considered not to comply with the mandatory values.

5. General information ⁽¹⁾

Public information

The Ministry of Health and Consumption, using data supplied by the autonomous regions, publishes an annual report on the quality of bathing areas. This report is presented nationally to the press. In addition, during the bathing season the autonomous and local authorities provided the public with recent information on the quality of bathing areas via publication in the press, the posting of information at bathing sites and by radio broadcasts.

6. Infringement procedure

On 12 February 1998, the Court of Justice ruled that freshwater zones in Spain had failed to comply. As the Spanish authorities have not taken any measures to comply with the Court's judgment, the Commission has sent a letter of formal notice as provided for in Article 228 of the Treaty.

⁽¹⁾ The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

7. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Coastal zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		5	3	4	24	0	153	1 449	1 633
NEW	14				2		2	10	14
Ban	2		2						2
NS	3			3					3
NC	31				12		5	14	31
Freq	0								
C (I)	163	2	1		5		90	65	161
C (G)	1 425	3		1	5		56	1 360	1 422
Tot. 99	1 624	5	3	4	22	0	151	1 439	1 467

Coastal zones (ratio = 1.2; stability = 90.6 %)

The ratio of 1.2 reflects a slight increase in the average quality of coastal bathing areas compared with the previous bathing season. It is accompanied by a high stability index, which suggests that few changes have occurred between bathing seasons and that those which have are generally for the better. It should be noted that 12 bathing areas complying with the guide and/or mandatory values have been added (and five withdrawn); the ratio does not take account of this, and so the upward trends is reinforced.

We see that 19 of the 31 bathing areas not complying with the mandatory values achieved compliance either with the mandatory values or with the stricter guide values, while only 10 bathing areas slipped the other way.

Almost 40 % of the bathing areas which complied with the mandatory values also achieved compliance with the stricter guide values during the 2000 bathing season. A smaller proportion of bathing areas (56 in all) slipped the other way.

The three bathing areas not sampled (and therefore not complying with the mandatory values) remained unsampled, and a new bathing area which had complied with the guide values during the 1999 bathing season was added to the list of unsampled areas.

Freshwater zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		14	10	1	29	2	97	63	202
NEW	3						3		3
Ban	21	3	8		5		4	1	18
NS	5			1	1		3		5
NC	23	3	1		8	1	8	2	20
Freq	1				1				1
C (I)	95	5			12	1	69	8	90
C (G)	68	3	1		2		10	52	65
Tot. 99	213	14	10	1	29	2	94	63	138

Freshwater zones (ratio = 1; stability = 69.3 %)

The ratio of 1 means no change since the previous bathing season. It should be noted, however, that eight bathing areas which had complied with the guide and/or mandatory values were withdrawn for the 2000 bathing season, while only three bathing areas complying with the mandatory values were added. The ratio does not take account of this, but that does not improve the results. The stability index is rather low, reflecting the fact that over 30 % of the bathing areas underwent a change of status from one bathing season to the next.

The changes are fairly erratic. While almost half of the bathing areas (10) which had not complied with the mandatory values achieved compliance with the mandatory values (in most cases) or with the stricter guide values, a far larger number of bathing areas (21) slipped out of compliance.

One positive trend deserves mention: while 16 bathing areas lost their mandatory-value compliance of the previous bathing season, 26 bathing areas acquired it. This trend is not repeated for the guide values, since while 11 bathing areas achieved compliance with the guide values, 13 areas lost that status, in most cases slipping to compliance only with the less strict mandatory values (in addition, three bathing areas were withdrawn).

OCEANO ATLÁNTICO

This is the second year in which no bathing water quality data were submitted to the European Commission (1999 and 2000 bathing seasons) due to industrial action by the staff responsible for forwarding the data to the central government level.

Nevertheless, measures to monitor bathing water quality (sampling, interpretation and dissemination of the results to the local bodies concerned and the public) and to protect bathers' health have continued throughout the bathing season.

The data will be sent to the European Commission as soon as the situation permits.

General information ⁽¹⁾

During the bathing season the public is kept informed of the most recent results, both at the bathing areas and at the town halls. During 2000 more than 1 200 bathing areas will be equipped with new display stands for these results plus more general information about the monitoring programme.

Despite the positive trend in the quality of wastewater treatment, particularly since the early 1990s and the entry into force of Directive 91/271/EEC concerning urban wastewater treatment, the local authorities must keep up their efforts to improve wastewater collection and the performance of their treatment plants. After all, various inquiries by the French Government into the causes of pollution at the small percentage of bathing areas classified as failing to comply (5 % in 1998) show that a quarter of these cases are due to inadequate wastewater treatment and a third are caused by spells of heavy rainfall. The French approach consists of providing beach users with information not only about the water quality but also about the causes of pollution and the remedial action in progress or planned. All this information provides a strong lever to encourage the mayors, who are responsible for wastewater treatment, to take action to combat pollution. To date about three quarters of the districts with bathing areas which failed to comply have introduced measures to combat pollution. The projects are implemented with the help of the water agencies which will contribute EUR 5 billion over the 1997–2001 period out of a total of EUR 10 billion budgeted for these schemes.

Infringement procedure

Proceedings were initiated before the Court of Justice in April 2000 for failure to monitor the 'total coliforms' parameter and for insufficient sampling.

⁽¹⁾ The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

1. 2000 bathing season

1 June to 31 August

2. Main results

Table 1 — Evolution of the results from 1992 to 2000

Σ : total number of bathing areas;

C (I) : percentage of bathing areas sufficiently sampled which comply with mandatory values;

C (G) : percentage of bathing areas sufficiently sampled which comply with guide values;

NF : percentage of bathing areas insufficiently sampled;

NC : percentage of bathing areas which do not comply with mandatory values or which are not sampled (or no data available);

NB : percentage of points where bathing was prohibited for the duration of the bathing season.

Parameters for which compliance is calculated: total coliforms, faecal coliforms, mineral oils, surface-active substances and phenols.

Ireland		Σ	C (I) (%)	C (G) (%)	NF (%)	NC (%)	NB (%)

	2000	9	100,0	88,9	0,0	0,0	0,0

Figure 1 — Evolution of the results from 1992 to 2000

3. Number of bathing areas (coastal: 121; freshwater: 9)

As in the previous bathing season, no bathing areas were added or withdrawn during the 2000 bathing season in either the coastal or the freshwater zones.

4. Comments

For both the coastal and the freshwater zones, the results submitted for the bathing areas taken into account are excellent. In neither were there bathing areas which were insufficiently sampled and, as in the previous bathing seasons, there are still no areas in which bathing is prohibited.

In the coastal zones, there was again a very slight improvement compared with the previous bathing season. While the percentage of bathing areas complying with the mandatory values (98.3 %) remained virtually the same as in the previous bathing season (98.4 %), the percentage of bathing areas complying with the stricter guide values rose sharply from 89.3 to 91.7 % in the 2000 bathing season.

The results for the freshwater zones were identical to those reported for the 1998 and 1999 bathing seasons and are therefore still extremely positive. All bathing areas complied with the mandatory values and the percentage complying with the stricter guide values is 88.9 %, as it has been since the 1994 bathing season.

5. General information (1)

Information to the public

A national report on the quality of bathing water for the 1998 season will be published in the framework of the measures for disseminating information carried out by the Environmental Protection Agency. The national results will also be published in bulletins from the Environmental Protection Agency and the Department of the Environment and Local Government. These bulletins are widely distributed and made available to the public free of charge. Recourse to the Internet site of the Environmental Protection Agency was explored as a means of circulating a summary report on bathing water for the 1997 season. The summary report for the 1998 bathing season will also be made available on the Internet site of the Environmental Protection Agency.

Wastewater treatment

As certain bathing areas in the Dublin region present recurrent pollution problems, Ireland has informed the Commission of the authorities' intention to treat wastewater at Ringsend. This work was expected to commence in 1999.

(1) The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

6. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Coastal zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		0	0	0	2	0	8	111	121
NEW	0								0
Ban	0								0
NS	0								0
NC	2				1			1	2
Freq	0								0
C (I)	11				1		4	6	11
C (G)	108						4	104	108
Tot. 99	121	0	0	0	2	0	8	111	109

Coastal zones (ratio = 1.4; stability = 90.1 %)

The ratio of 1.4 shows a rise in the average quality of bathing water compared with the previous bathing season. With high rates of bathing area compliance, both with the mandatory values and with the stricter guide values, the stability index of 90.1 % shows that the quality of bathing areas is being well maintained from one bathing season to the next.

The cross-reference table shows that over 50 % of the bathing areas which previously complied only with the mandatory values also achieved compliance with the stricter guide values during the 2000 bathing season. This upwards trend is somewhat offset by the four bathing areas which lost their guide-value compliance in the 2000 bathing season, slipping to compliance only with the less strict mandatory values.

The status quo was maintained for bathing areas not complying with the mandatory values. One of the two bathing areas which did not comply with the mandatory values during the previous bathing season achieved compliance with the guide values during the 2000 bathing season, while another bathing area which complied with the mandatory values during the 1999 bathing season lost that compliance.

Freshwater zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		0	0	0	0	0	1	8	9
NEW	0								0
Ban	0								0
NS	0								0
NC	0								0
Freq	0								0
C (I)	1							1	1
C (G)	8						1	7	8
Tot. 99	9	0	0	0	0	0	1	8	7

Freshwater zones (ratio = 1.0; stability = 77.8 %)

The ratio of 1 shows the average quality of bathing water to be unchanged from the 1999 bathing season. In fact, while one bathing area complying with the mandatory values set by the directive also achieved compliance with the guide values during the 2000 season, another bathing area which had complied with the guide values during the 1999 season lost that status, slipping back to compliance only with the less strict mandatory values.

The stability index is fairly high in terms of freshwater zones, but is of little significance here given the small number of bathing areas taken into account.

Figure 1 — Evolution of the results from 1992 to 2000

3. Number of bathing areas (coastal: 4 820; freshwater: 711)

In the case of the coastal zones, 52 bathing areas were withdrawn and 61 new bathing areas were taken into account for the 2000 bathing season. For the freshwater zones, 22 bathing areas were withdrawn and 9 new bathing areas were taken into account.

4. Comments

Although the results reported are still generally excellent, there has been a slight fall in the average quality of both coastal and (to a lesser extent) freshwater bathing areas. In the coastal zones, this is chiefly due to the 1.1 % increase in the percentage of bathing areas insufficiently sampled, since the percentage of bathing areas not complying with the mandatory values fell by 0.6 % during the 2000 bathing season. For the freshwater zones, there was a sharp drop (3.9 %) in the percentage of bathing areas complying with the guide values since, there too, the percentage of bathing areas not complying with the mandatory values fell by 1 %.

To find yet again that there are some (coastal) bathing areas which continue to be insufficiently sampled and that the situation is worse than in the previous bathing season is unacceptable since the sampling frequency is clearly defined for each bathing area and is not open to interpretation.

The results are still quite high for the coastal zones, especially as a large number of bathing areas were taken into account in the 2000 bathing season. 91.9 % of bathing areas complied with the guide values and 95.6 % with the mandatory values. 2.9 % of bathing areas failed to comply with the mandatory values and 1.5 % of bathing areas were insufficiently sampled.

For the freshwater zones, the percentage of bathing areas complying with the guide values fell sharply compared with the previous bathing season and is 69.9 %. There was a rise in the number of bathing areas complying with the less strict mandatory values from 94.8 % in the previous bathing season to 95.8 %. 4.2 % of bathing areas did not comply with the mandatory values. There were no bathing areas which were insufficiently sampled.

There are no coastal or freshwater bathing areas in which bathing is prohibited

5. General information (1)

Public information

Information concerning the bathing area monitoring programme is available on teletext pages. In addition, a report describing bathing water quality is published annually.

Wastewater treatment

Italy did not provide any specific data on its projects for wastewater treatment in bathing areas.

6. Infringement procedure

A reasoned opinion has been sent to the Italian authorities for insufficient sampling and non-compliance.

(1) The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

7. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Coastal zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		52	0	0	138	74	180	4 428	4 820
NEW	61				6	5	8	42	61
Ban	0								
NS	0								0
NC	169	8			62	2	41	56	161
Freq	19					10		9	19
C (I)	178	18			20		51	89	160
C (G)	4 445	26			50	57	80	4 232	4 419
Tot. 99	4 811	52	0	0	132	69	172	4 386	4 355

Coastal zones (ratio = 0.94; stability = 91.5 %)

The ratio is just below 1, signifying that the average quality of bathing areas is slightly down compared with the previous bathing season. However, the stability index is high, indicating that this fall only affects a small percentage of bathing areas.

The number of insufficiently sampled bathing areas rose significantly compared with the previous bathing season. While 9 insufficiently sampled bathing areas achieved compliance with the guide values during the 2000 bathing season, 57 bathing areas which previously complied with the guide values were insufficiently sampled.

Similarly, while 154 bathing areas which had been insufficiently sampled, in non-compliance, or in compliance with the mandatory values achieved compliance with the guide values during the 2000 bathing season, a larger number of bathing areas (187) lost that status. Meanwhile, while 106 bathing areas achieved compliance with the mandatory values during the 2000 season, 127 slipped out of compliance.

Freshwater zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		22	0	0	30	0	184	497	711
NEW	9						3	6	9
Ban	0								
NS	0								0
NC	38	5			8		19	6	33
Freq	0								0
C (I)	152	5			14		90	43	147
C (G)	534	12			8		72	442	522
Tot. 99	724	22	0	0	30	0	181	491	540

Freshwater zones (ratio = 0.72; stability = 76.9 %)

The ratio is fairly low, indicating a significant fall in the average quality of bathing areas compared with the previous bathing season. However, this needs to be seen in context: the cross-reference table shows the fall to be associated primarily with the 72 bathing areas which complied with the guide values during the 1999 bathing season but have slipped to compliance only with the less strict mandatory values — only 49 bathing areas previously in non-compliance or in compliance only with the mandatory values achieved compliance with the guide values.

The stability index of 76.9 % is a fairly good average for freshwater zones, whose quality seems harder to maintain from one bathing season to the next than that of coastal zones.

We see that 25 of the 38 bathing areas not complying with the mandatory values during the 1999 bathing season achieved compliance with the guide and/or mandatory values (5 were withdrawn), while on the other hand 22 bathing areas which previously complied with the guide and/or mandatory values slipped to non-compliance with the mandatory values.

1. 2000 bathing season

15 May to 31 August

2. Main results

Table 1 — Evolution of the results from 1992 to 2000

Σ : total number of bathing areas;

C (I) : percentage of bathing areas sufficiently sampled which comply with mandatory values;

C (G): percentage of bathing areas sufficiently sampled which comply with guide values;

NF : percentage of bathing areas insufficiently sampled;

NC : percentage of bathing areas which do not comply with mandatory values or which are not sampled (or no data available);

NB : percentage of points where bathing was prohibited for the duration of the bathing season.

Parameters for which compliance is calculated: total coliforms, faecal coliforms, mineral oils, surface-active substances and phenols.

Luxembourg		Σ	C (I) (%)	C (G) (%)	NF (%)	NC (%)	NB (%)
Freshwater zones	1992	20	75,0	55,0	0,0	0,0	25,0
	1993	20	80,0	55,0	0,0	0,0	20,0
	1994	20	85,0	55,0	0,0	0,0	15,0
	1995	20	85,0	55,0	0,0	0,0	15,0
	1996	20	85,0	50,0	0,0	0,0	15,0
	1997	20	85,0	55,0	0,0	0,0	15,0
	1998	20	85,0	55,0	0,0	0,0	15,0
	1999	20	85,0	55,0	0,0	0,0	15,0
	2000	20	85,0	55,0	0,0	0,0	15,0

Figure 1 — Evolution of the results from 1992 to 2000

3. Number of bathing areas (freshwater: 20)

Luxembourg has no coastal zones and takes 20 freshwater bathing areas into account. No bathing areas were withdrawn or added compared with the previous bathing season.

4. Comments

The situation is exactly the same as in the previous bathing season. Regrettably, there has been no change since the 1994 bathing season.

- 17 of the 20 bathing areas complied with the mandatory values, giving a compliance rate of 85 % for the mandatory values.
- 11 of the 17 bathing areas also complied with the stricter guide values, giving a compliance rate of 55 % for the guide values.
- as in previous bathing seasons, bathing remained prohibited for health reasons in three bathing areas, giving a percentage of 15 %.

5. General information ⁽¹⁾

Public information

Article 9 of the Grand-Ducal Regulation stipulates that the public is informed of the results concerning bathing water quality. Suitable information is posted in the town halls concerned and at bathing spots. In the event of a ban on bathing, failure to post visible warnings carries heavy penalties.

Wastewater treatment

The ban on bathing is maintained for the three bathing areas restricted since 1989, despite the constant quality improvement since the entry into service of the Born sewage treatment plant.

The call for tenders for the work to enlarge the Echternach sewage treatment plant had to be launched in 1998. The same also applies for the project of the Rosport sewage treatment plant.

⁽¹⁾ The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

6. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Freshwater zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		0	3	0	0	0	6	11	20
NEW	0								0
Ban	3		3						3
NS	0								0
NC	0								0
Freq	0								0
C (I)	6						6		6
C (G)	11							11	11
Tot. 99	20	0	3	0	0	0	6	11	20

Freshwater zones (ratio = 1.0; stability = 100 %)

The ratio of 1 and the stability index of 100 % show that no changes have occurred from one bathing season to the next.

No improvement in status has been observed since the 1997 bathing season. The three prohibited bathing areas remain closed to bathing.

	2000	557	96,2	64,5	0,7	2,7	0,4

Figure 1 — Evolution of the results from 1992 to 2000

3. Number of bathing areas (coastal: 78; freshwater: 557)

No coastal bathing areas were added or withdrawn compared with the previous bathing season. Seven freshwater bathing areas were withdrawn and 36 new freshwater bathing areas were taken into account for the 2000 bathing season.

4. Comments

Although the situation was almost identical to the previous bathing season in the coastal zones, there was a further improvement in the freshwater zones. However, the insufficient sampling in some (freshwater) bathing areas is unacceptable since the sampling frequency is clearly defined for each bathing area and is not open to interpretation.

In the coastal bathing areas, there were high percentages of compliance with both the mandatory values (98.7 %) and the stricter guide values (96.2 %). While there was no change in the percentage of compliance of bathing areas with the mandatory values compared with the previous bathing season, this was not the case with the percentage of compliance with the guide values, which rose by 2.6 %.

In the freshwater bathing areas, there was a sharp increase in the compliance rate with the guide and/or mandatory values. The percentage of bathing areas complying with the mandatory values rose from 90.7 to 96.2 % for the 2000 bathing season, while the percentage complying with the stricter guide values rose from 60.4 % for the 1999 bathing season to 64.5 % (which still leaves room for improvement). Although there was a very slight fall in the percentage of bathing areas insufficiently sampled (from 0.8 to 0.7 % in the 2000 bathing season), the percentage failing to comply with the mandatory values (2.7 %) fell by more than 5 % compared with the previous bathing season. Finally, the percentage of areas where bathing was prohibited fell from 0.6 to 0.4 % for the 2000 bathing season.

5. General information ⁽¹⁾

Public information

Procedures for providing the public with information vary from one province to another. In general, material can be obtained from tourist offices and the provincial authorities. In addition, the latest information about areas where bathing is prohibited or where there are certain risks (botulism, blue-green alga, etc.) can be obtained from teletext (page 725) or the Internet. Information about the quality of bathing areas is available locally in the busiest coastal bathing areas.

Wastewater treatment

Considerable effort has been made to reduce the run-off of drainage waters to surface waters. At the moment, this water is collected in drains.

6. Infringement procedure

Proceedings were initiated before the Court of Justice in July 2000 for insufficient sampling and non-compliance.

⁽¹⁾ The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

7. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Coastal zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		0	0	0	1	0	2	75	78
NEW	0								0
Ban	0								0
NS	0								0
NC	1							1	1
Freq	0								0
C (I)	4						1	3	4
C (G)	73				1		1	71	73
Tot. 99	78	0	0	0	1	0	2	75	72

Coastal zones (ratio = 2.0; stability = 92.3 %)

The ratio of 2 shows that the average quality of the bathing areas taken into account during the 2000 bathing season improved appreciably compared with the previous season. This is excellent news, inasmuch as a high proportion of bathing areas complied with the mandatory and guide values. The stability index of 92.3 % shows, in addition, that most of the bathing areas retained the status they had during the 1999 bathing season and therefore that very few changes occurred. This is an ideal situation, combining high compliance rates with a ratio greater than 1 and a high stability index.

The cross-reference table shows that three of the four bathing areas which complied only with the mandatory values during the 1999 bathing season achieved compliance with the stricter guide values during the 2000 season. One bathing area slipped the other way, offsetting this positive trend very slightly.

The number of bathing areas not complying with the mandatory values remains unchanged, as the bathing area which previously had that status achieved compliance with the guide values during the 2000 bathing season while another bathing area previously complying with the guide values failed to comply even with the less strict mandatory values.

Freshwater zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		7	2	0	15	4	177	359	557
NEW	36				1	2	13	20	36
Ban	3						1	2	3
NS	0								0
NC	42	1	1		3		19	18	41
Freq	4						1	3	4
C (I)	160	2	1		9		91	57	158
C (G)	319	4			2	2	52	259	315
Tot. 99	528	7	2	0	14	2	164	339	353

Freshwater zones (ratio = 1.5; stability = 67.8 %)

The ratio of 1.5 reflects a significant improvement in the average quality of bathing areas for the latest bathing season. Unlike the situation for coastal zones, the stability index is fairly low, indicating many changes in the status of bathing areas. This has no negative implication, inasmuch as the ratio itself is fairly high, indicating that those changes are positive.

The most appreciable improvement is in the number of bathing areas which had failed to comply with the mandatory values during the previous bathing season but which achieved compliance with the mandatory or stricter guide values (in more or less equal numbers) during the 2000 season. In all, 88 % of bathing areas saw their status improve in this way.

We see also that, while the number of bathing areas shifting between compliance with the mandatory values or the stricter guide values more or less balances out, the improvement seen in 2000 is also due to the fact that the vast majority of the 36 new bathing areas taken into account complied with the mandatory values, while over half of them also complied with the stricter guide values.

Some bathing areas remained insufficiently sampled. This is particularly regrettable as the sampling frequency is clear for each bathing area, and because the bathing areas in question were either sufficiently sampled during the previous bathing season or have been newly taken into account.

1. 2000 bathing season

In general from 15 June to 31 August

2. Main results

Table 1 — Evolution of the results from 1997 to 2000

Σ : total number of bathing areas;

C (I) : percentage of bathing areas sufficiently sampled which comply with mandatory values;

C (G): percentage of bathing areas sufficiently sampled which comply with guide values;

NF : percentage of bathing areas insufficiently sampled;

NC : percentage of bathing areas which do not comply with mandatory values or which are not sampled (or no data available);

NB : percentage of points where bathing was prohibited for the duration of the bathing season.

Parameters for which compliance is calculated: total coliforms, faecal coliforms, mineral oils, surface-active substances and phenols.

Austria		Σ	C (I) (%)	C (G) (%)	NF (%)	NC (%)	NB (%)
Freshwater zones	1997	268	96,6	85,1	0,0	3,0	0,4
	1998	270	91,9	76,7	0,0	8,1	0,0
	1999	270	95,9	77,8	0,0	4,1	0,0
	2000	268	96,6	66,8	0,0	3,4	0,0

Figure 1 — Evolution of the results from 1997 to 2000

3. Number of bathing areas (freshwater: 268)

Austria does not have any coastal zones and has 268 freshwater bathing areas. Three bathing areas have been withdrawn and one new bathing area added since the previous bathing season.

4. Comments

Although the percentage of compliance of bathing areas with the mandatory values increased slightly, the average quality of the freshwater zones can be considered to have deteriorated since the previous bathing season given the sharp fall in the percentage of areas complying with the stricter guide values.

While the number of bathing areas in compliance with the mandatory values rose from 95.9 % in the previous bathing season to 96.6 % in 2000, the percentage of bathing areas complying with the stricter guide values fell by about 11 % from 77.7 % during the previous bathing season to only 66.8 % in the 2000 season.

Nonetheless, the number of bathing areas not complying with the mandatory values fell slightly from 4.1 % during the previous season to 3.4 % in the 2000 bathing season.

No bathing areas were insufficiently sampled and there were no areas where bathing was prohibited.

5. General information ⁽¹⁾

The quality of bathing water in the 'Langenloiser Flussbad am Kamp' area is improving all the time, very largely due to the progress in the work on the collection of wastewater in the 'Langenlois-Schönberg/Kamp' area. This work will be completed in 2004 (two major stages are in 2001 and 2002).

⁽¹⁾ The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

6. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Freshwater zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		3	0	0	9	0	80	179	268
NEW	1						1		1
Ban	0								
NS	0								0
NC	11				1		4	6	11
Freq	0								
C (I)	49				5		29	15	49
C (G)	210	3			3		46	158	207
Tot. 99	270	3	0	0	9	0	79	179	188

Freshwater zones (ratio = 0.46; stability = 70.4 %)

The ratio is well below 1, showing that the average quality of bathing areas has fallen appreciably since the previous bathing season. The stability index is not high, but remains more or less within the norm given that it is more difficult to maintain the average quality of bathing water in freshwater zones than in coastal zones.

We see that three bathing areas in compliance with the guide values were withdrawn, while one new bathing area complying only with the less strict mandatory values was taken into account for the 2000 bathing season.

The most striking fact is that over 20 % of the bathing areas have lost their guide-value compliance of the previous bathing season, slipping to compliance only with the less strict mandatory values (in the vast majority of cases), or to non-compliance, or being withdrawn.

The fact that 10 bathing areas which had not complied with the mandatory values achieved compliance, in almost equal proportions, with the mandatory values or the guide values during the 2000 bathing season goes almost unnoticed in these circumstances.

1. 2000 bathing season

Portugal: 1 June to 30 September
Autonomous Region of the Açores: 15 June to 15 September

2. Main results

Table 1 — Evolution of the results from 1992 to 2000

Σ : total number of bathing areas;

C (I) : percentage of bathing areas sufficiently sampled which comply with mandatory values;

C (G): percentage of bathing areas sufficiently sampled which comply with guide values;

NF : percentage of bathing areas insufficiently sampled;

NC : percentage of bathing areas which do not comply with mandatory values or which are not sampled (or no data available);

NB : percentage of points where bathing was prohibited for the duration of the bathing season.

Parameters for which compliance is calculated: total coliforms, faecal coliforms, mineral oils, surface-active substances and phenols.

Portugal		Σ	C (I) (%)	C (G) (%)	NF (%)	NC (%)	NB (%)

	2000	42	69,0	31,0	0,0	31,0	0,0

Figure 1 — Evolution of the results from 1992 to 2000

3. Number of bathing areas (coastal: 345; freshwater: 42)

Six coastal bathing areas were withdrawn and nine new coastal areas were taken into account during the 2000 bathing season. One freshwater bathing area was withdrawn and six new areas were added since the previous new bathing season.

4. Comments

Unlike the 1999 bathing season, which saw a very significant improvement in average bathing water quality (in both coastal and freshwater zones), the 2000 bathing season was marked by a sharp fall in compliance with the mandatory values for bathing areas, especially in the case of freshwater areas. Generally, there were no insufficiently sampled bathing areas and, as in previous bathing seasons, there were no areas where bathing was prohibited.

In the coastal zones, the deterioration in average bathing water quality was less pronounced. The percentages of bathing areas complying with the guide and/or mandatory values fell by 1.9 and 1.7 % respectively to 81.4 and 92.2 % in the 2000 bathing season. The percentage of bathing areas not complying with the mandatory values rose by 1.7 % compared with the previous bathing season to 7.8 % (an abnormally high figure).

The situation worsened considerably in the freshwater zones, despite the fact that the results were not outstanding in the 1999 bathing season. Although it was already quite low, the percentage of bathing areas complying with the mandatory values (69 %) fell sharply compared with the previous bathing season, with a drop of 9.4 % in the 2000 bathing season. On a positive note, however, the percentage of bathing areas complying with the guide values increased from 12.1 % in 1999 to 31 % in the 2000 bathing season. This figure is nonetheless abnormally low and cannot be accepted as satisfactory. There was an equally dramatic rise in the percentage of bathing areas failing to comply with the mandatory values, from 21.6 % in the 1999 bathing season to 30.9 % in the 2000 season. This means that practically one in three areas fails to comply with the mandatory values laid down by the Community directive.

5. General information ⁽¹⁾

Public information

Every year since 1989, the Ministries of the Environment and Health have published a document on the quality of bathing areas which is distributed and posted in health centres, tourism offices, harbour master's offices in ports and in bathing areas. Information on bathing areas is also provided to the public on the Internet.

Wastewater treatment

A major project for the treatment of wastewater has been implemented along the Estoril coast: it includes the building of a large sewage outfall in the sea measuring 2 km, as well as a treatment plant for urban wastewater in the Lisbon region. Another large project is foreseen for the region of Porto and the Algarve.

6. Infraction procedure

The Commission decided to initiate proceedings before the Court of Justice against Portugal for non-compliance and insufficient sampling.

⁽¹⁾ The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

7. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Coastal zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		6	0	0	27	0	37	281	345
NEW	9							9	9
Ban	0								0
NS	0								0
NC	21				10		5	6	21
Freq	0								0
C (I)	36				10		17	9	36
C (G)	285	6			7		15	257	279
Tot. 99	342	6	0	0	27	0	37	272	284

Coastal zones (ratio = 0.6; stability = 84.5 %)

The ratio of 0.6 shows that the average status of bathing water was appreciably worse during the 2000 bathing season than during the previous season. The nine new bathing areas taken into account during the 2000 bathing season, all of which complied with the guide values, offset this to some extent, although six bathing areas with guide-value status were withdrawn.

The stability index is still low, considering that the quality of coastal zones seems more easily maintained from one bathing season to the next than that of freshwater zones. The index shows that over 15 % of bathing areas have seen their status change from one bathing season to the next, generally for the worse.

While a majority of the bathing areas which did not comply with the mandatory values during the 1999 bathing season achieved compliance, in almost equal proportions, with the guide values or the mandatory values, a considerably larger number of bathing areas which complied with the mandatory or guide values during the previous bathing season have lost that status, slipping to non-compliance or being withdrawn during the 2000 bathing season.

Freshwater zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		1	0	0	13	0	16	13	42
NEW	6							6	6
Ban	0								0
NS	0								0
NC	8				7		1		8
Freq	0								0
C (I)	22				5		11	6	22
C (G)	7	1			1		4	1	6
Tot. 99	37	1	0	0	13	0	16	7	19

Freshwater zones (ratio = 0.7; stability = 52.8 %)

As with the coastal zones, the ratio shows that the average quality of freshwater bathing areas is significantly down on the previous bathing season. As with the coastal zones, the addition of six bathing areas during the 2000 bathing season, all of them complying with the guide values, redresses this drop in quality to some extent.

The stability index is particularly low, indicating that virtually one bathing area in two (taken into account during the previous bathing season) has undergone a change of status since the previous bathing season, i.e. a change for the worse.

Just one bathing area not complying with the mandatory values during the previous bathing season achieved compliance with the mandatory values during the 2000 bathing season, while seven bathing areas complying with the mandatory or guide values slipped into non-compliance or were withdrawn.

The percentage of bathing areas complying with the guide values has risen with the addition of the new bathing areas taken into account during the 2000 bathing season, and thanks also to six bathing areas which were in compliance with the mandatory values and have now achieved compliance with the stricter guide values (four bathing areas lost that status, slipping to compliance only with the mandatory values).

1. 2000 bathing season

1 June to 15 August and in Lapland from 15 June to 15 August

2. Main results

Table 1 — Evolution of the results from 1995 to 2000

Σ : total number of bathing areas;

C (I) : percentage of bathing areas sufficiently sampled which comply with mandatory values;

C (G): percentage of bathing areas sufficiently sampled which comply with guide values;

NF : percentage of bathing areas insufficiently sampled;

NC : percentage of bathing areas which do not comply with mandatory values or which are not sampled (or no data available);

NB : percentage of points where bathing was prohibited for the duration of the bathing season.

Parameters for which compliance is calculated: total coliforms, faecal coliforms, mineral oils, surface-active substances and phenols.

Finland		Σ	C (I) (%)	C (G) (%)	NF (%)	NC (%)	NB (%)
Coastal zones	1995	100	73,0	61,0	25,0	2,0	0,0
	1996	101	80,2	72,3	19,8	0,0	0,0
	1997	94	58,5	47,9	6,4	34,0	1,1
	1998	94	84,0	69,1	4,3	10,6	1,1
	1999	93	91,4	60,2	5,4	3,2	0,0
	2000	113	98,2	77,9	0,9	0,9	0,0
Freshwater zones	1995	378	83,1	75,9	16,4	0,5	0,0
	1996	391	77,0	73,9	22,8	0,3	0,0
	1997	360	60,6	56,9	3,6	35,3	0,5
	1998	357	83,2	77,3	14,9	1,9	0,0
	1999	343	85,4	67,9	12,5	0,6	1,5
	2000	332	98,8	78,6	0,9	0,0	0,3

Figure 1 — Evolution of the results from 1995 to 2000

3. Number of bathing areas (coastal: 113; freshwater: 332)

Finland has taken into account 113 coastal bathing areas for the 2000 bathing season: 24 new areas were added and 4 were withdrawn. In the freshwater zones, 332 bathing areas were taken into account: 14 were withdrawn and 3 new bathing areas were added.

4. Comments

Average bathing water quality is improving considerably compared with the previous bathing season, both in coastal and freshwater zones. However, it is strange to find that bathing areas continue to be insufficiently sampled (0.9 % in coastal and freshwater zones), even if the number of such areas has fallen sharply, especially in the case of freshwater zones, compared with the 2000 bathing season. This is a particularly negative point since the sampling frequency is clearly defined for each bathing area and is not open to interpretation.

In the coastal zones, the percentages of bathing areas complying with the mandatory values (98.2 %) and the stricter guide values (77.9 %) rose significantly (from 6.8 and 17.6 % respectively in the previous bathing season). This was accompanied by a sharp fall in the number of bathing areas failing to comply with the mandatory values. Although 3.2 % of bathing areas did not comply with the mandatory values in the 1999 bathing season, the figure fell to 0.9 % in 2000.

In the freshwater zones, the situation is equally remarkable. All bathing areas — except three which were insufficiently sampled — were in compliance with the mandatory values. The percentage of bathing areas complying with the mandatory values is therefore rising significantly, from 85.4 % in the 1999 bathing season to 98.8 % in the 2000 season. The same applies to the percentage of bathing areas complying with the guide values (78.6 %), a rise of over 10 % compared with the previous bathing season. The percentage of bathing areas at which bathing was prohibited also fell from 1.5 % in the 1999 bathing season to 0.3 % in the 2000 season.

5. General information ⁽¹⁾

Public information

As required by the decision of the Ministry of Social Affairs and Health, the most recent results on the monitoring programme are posted in each public bathing area.

Other information

Finland has stated that, with the exception of the abovementioned bathing areas, its territory includes more than 2 000 small public bathing areas, and more than 400 000 private summer cottages are near bathing water. Given the low number of bathers, the latter do not correspond to the definition of Article 1 of the directive and are therefore not monitored systematically, as required by the directive.

6. Infraction procedure

A reasoned opinion has been sent to the Finnish authorities for failure to transpose, insufficient sampling and non-compliance.

⁽¹⁾ The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

7. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Coastal zones (TC, FC, MO, SA, PHE)									
	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		4	0	0	1	1	23	88	113
NEW	24				1	1	4	18	24
Ban	0								0
NS	0								0
NC	3						1	2	3
Freq	5							5	5
C (I)	29						11	18	29
C (G)	56	4					7	45	52
Tot. 99	93	4	0	0	0	0	19	70	56

Coastal zones (ratio = 3.71; stability = 62.9 %)

The ratio is exceptionally high, so the stability index is bound to be low. A major increase in average bathing water quality is observed for the 2000 bathing season, indicating that many bathing areas have seen their status improve: 47.1 % of the areas taken into account in both the 1999 and 2000 bathing seasons have seen their status change from one season to the other.

In fact, over 60 % of the bathing areas which complied only with the mandatory values during the 1999 bathing season also achieved compliance with the stricter guide values during the 2000 bathing season. Moreover, though four bathing areas in compliance with the guide values were withdrawn, a large number of new bathing areas were taken into account during the 2000 bathing season (over 20 % of the total number of bathing areas), the vast majority of which comply with the mandatory values or with the stricter guide values. No particular deterioration is observed, aside from seven bathing areas which had complied with the guide values during the previous bathing season but which slipped during the 2000 bathing season to compliance only with the less strict mandatory values.

Freshwater zones (TC, FC, MO, SA, PHE)									
	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		14	1	0	0	3	67	261	332
NEW	3							3	3
Ban	5	3					1	1	2
NS	0								0
NC	2						1	1	2
Freq	43	3				2	6	32	40
C (I)	60	4					33	23	56
C (G)	233	4	1			1	26	201	229
Tot. 99	343	14	1	0	0	3	67	258	236

Freshwater zones (ratio = 2.32; stability = 71.7 %)

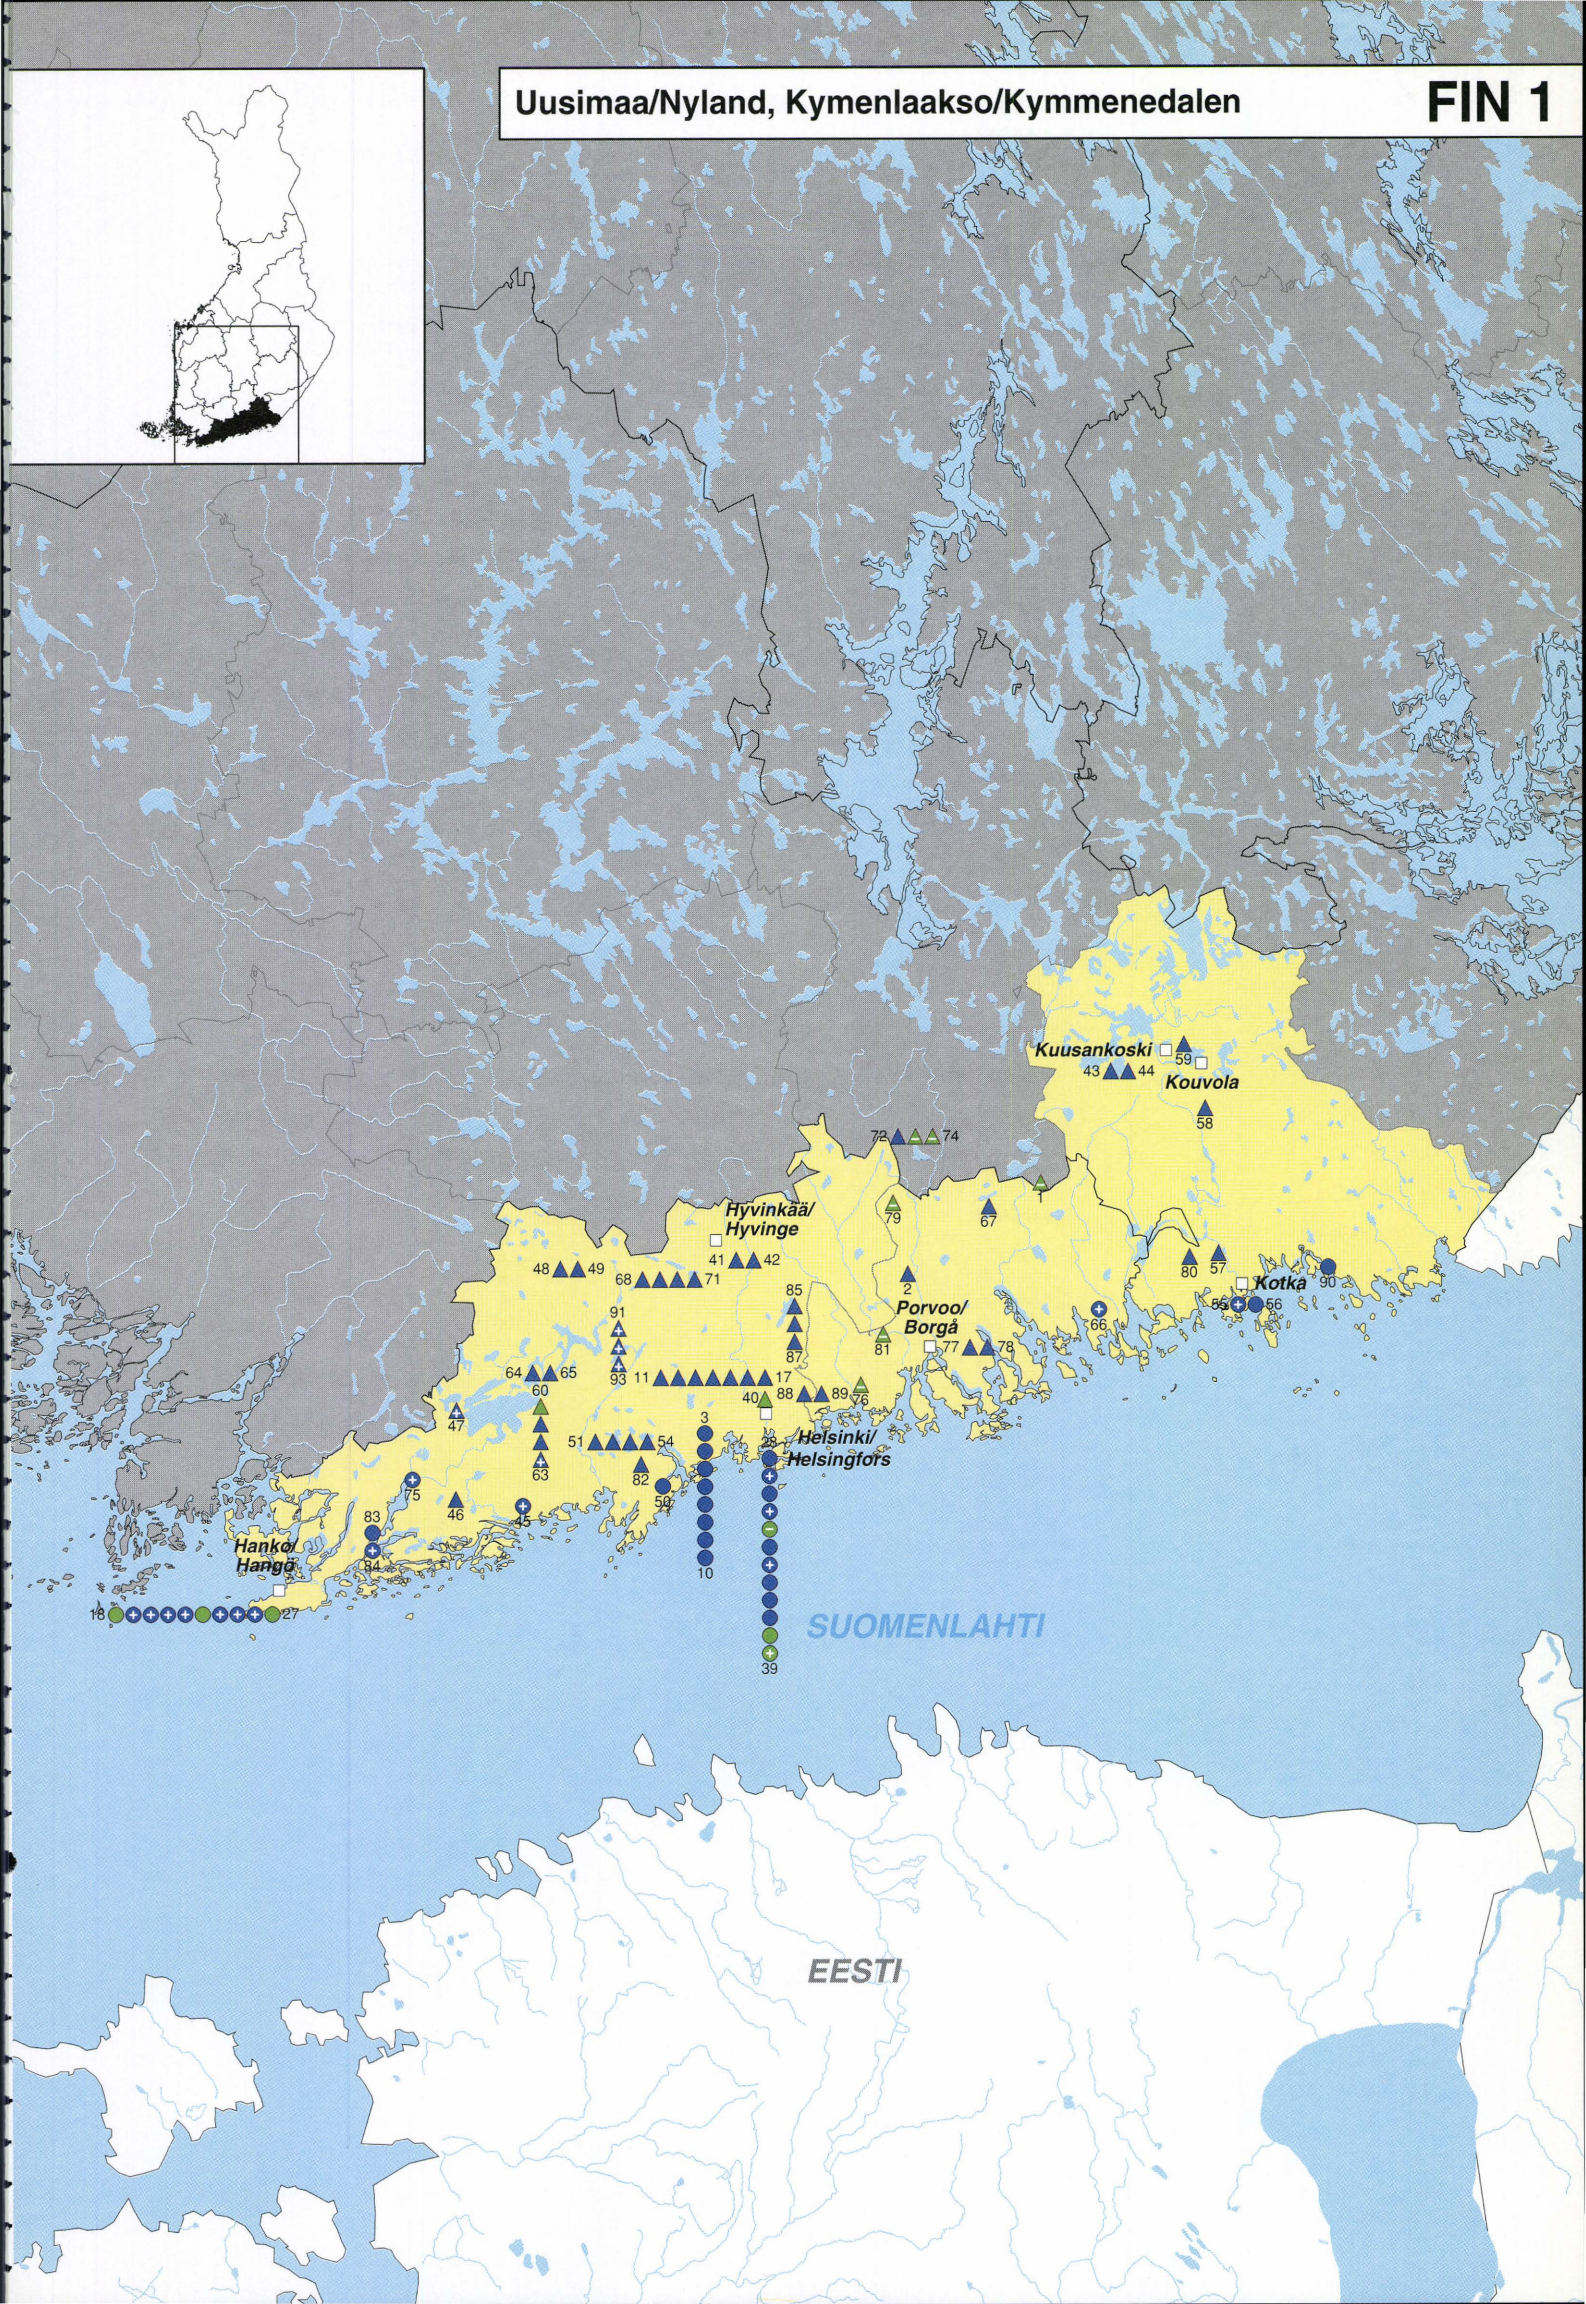

Virtually the same comments as for the coastal zones. The ratio is high, indicating changes in status for the better from one bathing season to the next. As with the coastal zones, the ratio is associated with a fairly low stability index; major changes have therefore occurred, pushing up the average quality of freshwater zones.

There is one difference, though: while for coastal zones the improvement is linked in part to the addition of new bathing areas, most of which complied with the guide and/or mandatory values during the 2000 bathing season, the improvement in the freshwater zones relates almost entirely to bathing areas already taken into account during the previous bathing season.

In fact, over 90 % of the bathing areas which were insufficiently sampled during the previous bathing season achieved compliance with the mandatory values or the guide values, while almost 50 % of the bathing areas which complied only with the mandatory values during the 1999 bathing season also achieved compliance with the stricter guide values during the 2000 bathing season.

1. 2000 bathing season

1 to 2.5 months depending on the geographical location, but in general from 20 June to 20 August

2. Main results

Table 1 — Evolution of the results from 1995 to 2000

Σ : total number of bathing areas;

C (I) : percentage of bathing areas sufficiently sampled which comply with mandatory values;

C (G) : percentage of bathing areas sufficiently sampled which comply with guide values;

NF : percentage of bathing areas insufficiently sampled;

NC : percentage of bathing areas which do not comply with mandatory values or which are not sampled (or no data available);

NB : percentage of points where bathing was prohibited for the duration of the bathing season.

Parameters for which compliance is calculated: total coliforms, faecal coliforms, mineral oils, surface-active substances, and phenols.

Sweden		Σ	C (I) (%)	C (G) (%)	NF (%)	NC (%)	NB (%)
Coastal zones	1995	250	44,8	33,2	54,4	0,8	0,0
	1996	391	55,8	47,8	42,2	2,0	0,0
	1997	401	71,6	63,3	10,5	18,0	0,0
	1998	378	84,9	64,8	10,3	4,8	0,0
	1999	379	84,4	73,4	10,0	5,6	0,0
	2000	372	96,0	77,2	3,2	0,8	0,0
Freshwater zones	1995	352	62,3	52,3	37,4	0,3	0,0
	1996	488	62,7	56,1	36,7	0,6	0,0
	1997	522	54,4	48,1	21,3	24,3	0,0
	1998	462	74,0	62,8	23,2	2,8	0,0
	1999	412	80,8	66,5	18,0	1,2	0,0
	2000	401	96,5	81,0	3,5	0,0	0,0

Figure 1 — Evolution of the results from 1995 to 2000

3. Number of bathing areas (coastal: 372; freshwater: 401)

In the coastal zones, 17 bathing areas were withdrawn and 10 new areas added for the 2000 bathing season. In the freshwater zones, 18 bathing areas were withdrawn and 10 new bathing areas were taken into account. For the freshwater bathing areas, this is the second year running in which the number of bathing areas monitored has fallen.

4. Comments

Bathing water quality improved considerably compared with the previous season, both in coastal and freshwater zones. Although the percentage of bathing areas insufficiently sampled in the 2000 bathing season fell sharply — from 10 % in the case of coastal zones in 1999 to 3.2 % in 2000 and from 18 % in the case of freshwater zones in 1999 to 3.5 % in 2000 — the situation is still not satisfactory. This is a particularly negative point since the sampling frequency is clearly defined for each bathing area and is not open to interpretation.

In the coastal zones, there was more particularly a very steep rise in the percentage of bathing areas complying with the mandatory values. The percentages of areas complying with the guide values (77.2 %) and/or mandatory values (96 %) rose by 3.8 and 11.6 % respectively compared with the previous bathing season, while the percentage of bathing areas failing to comply with the mandatory values (0.8 %) fell by 4.7 %.

In the freshwater zones, the improvement was even more striking. There were no bathing areas which failed to comply with the mandatory values and the percentages of bathing areas complying with the mandatory and the stricter guide values were relatively high (especially in the freshwater areas).

The percentages of bathing areas complying with the guide values (81 %) and/or mandatory values (96.5 %) rose by 14.5 and 15.7 % respectively compared with the previous bathing season.

There were no coastal or freshwater zones where bathing was prohibited.

5. General information (1)

Public information

The Swedish Environment Protection Agency publishes the results of sampling in bathing areas for the two previous bathing seasons on its Internet site. A large number of local authorities include the latest results on their web sites, to which the agency's site provides hyperlinks.

6. Infringement procedure

Proceedings were brought against Sweden in October 2000 for failure to transpose, insufficient sampling and poor application of the directive.

(1) The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

7. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Coastal zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		17	0	0	3	12	70	287	372
NEW	10						2	8	10
Ban	0								
NS	0								0
NC	21				2		12	7	21
Freq	38	12				11	2	13	26
C (I)	42				1		12	29	42
C (G)	278	5				1	42	230	273
Tot. 99	379	17	0	0	3	12	68	279	255

Coastal zones (ratio = 1.43; stability = 70.4 %)

The ratio of 1.43 shows an improvement in the average status of the bathing areas taken into account during the 2000 bathing season compared with the previous season. The addition of 10 bathing areas during the 2000 bathing season (not taken into account in the ratio), all of them in compliance with the guide and/or mandatory values, accentuates this trend. The stability index is fairly low, but is fortunately associated with a ratio greater than 1. It reflects the fact that 33.8 % of the bathing areas taken into account during the 1999 bathing season changed status during the 2000 bathing season.

We see both that the number of bathing areas insufficiently sampled during the 1999 bathing season fell considerably (most of them achieving compliance with the guide (the majority) and/or mandatory values, the others being withdrawn), and that over 90 % of the bathing areas which had not complied with the mandatory values achieved compliance with the guide and/or mandatory values.

The main fall in quality observed from one bathing season to the next is due to the 42 bathing areas which slipped from guide-value compliance to compliance only with the less strict mandatory values during the 2000 bathing season.

Freshwater zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		18	0	0	0	14	62	325	401
NEW	7							7	7
Ban	0								
NS	0								0
NC	5	1					1	3	4
Freq	74	8				8	8	50	66
C (I)	59	3				2	21	33	56
C (G)	274	6				4	32	232	268
Tot. 99	412	18	0	0	0	14	62	318	261

Freshwater zones (ratio = 2.5; stability = 66.2 %)

The ratio is way over 1, showing a major improvement in the average quality of bathing water during the 2000 bathing season. The relatively low stability index is by no means bad in such circumstances, as it signals the fact that a great many changes have occurred, the vast majority of them being improvements in the status of the bathing areas in question. Half the bathing areas withdrawn during the 2000 bathing season were in non-compliance or insufficiently sampled.

All the bathing areas in non-compliance with the mandatory values during the 1999 bathing season achieved compliance with the guide and/or mandatory values (except one, which was withdrawn). The same applies to most of the insufficiently sampled bathing areas, the majority of which achieved compliance with the guide values.

Just as for the coastal zones, the main fall in quality observed from one bathing season to the next is due to the 32 bathing areas which lost their previous compliance with the guide values and slipped to compliance only with the less strict mandatory values during the 2000 bathing season.

1. 2000 bathing season

England and Wales: 15 May to 30 September

Scotland and Northern Ireland: 1 June to 15 September

Gibraltar: 15 April to 30 October

2. Main results

Table 1 — Evolution of the results from 1992 to 2000

Σ : total number of bathing areas;

C (I) : percentage of bathing areas sufficiently sampled which comply with mandatory values;

C (G): percentage of bathing areas sufficiently sampled which comply with guide values;

NF : percentage of bathing areas insufficiently sampled;

NC : percentage of bathing areas which do not comply with mandatory values or which are not sampled (or no data available);

NB : percentage of points where bathing was prohibited for the duration of the bathing season.

Parameters for which compliance is calculated: total coliforms, faecal coliforms, mineral oils, surface-active substances, and phenols.

Figure 1 — Evolution of the results from 1992 to 2000

3. Number of bathing areas (coastal: 551; freshwater: 11)

In the coastal zones, 11 new bathing areas were taken into account for the 2000 bathing season and one bathing area was withdrawn. In the freshwater zones, 11 bathing areas were taken into account, as in the previous bathing season. This is the third year in which the United Kingdom has taken freshwater bathing areas into account, but regrettably there has been no increase in the number of bathing areas monitored, which is still unusually low.

Since the 1994 bathing season, Gibraltar has been taking six coastal bathing areas into account.

4. Comments

Although there was a slight improvement in average quality in coastal zones, there was, regrettably, for the second year running a deterioration in the quality of the bathing areas taken into account for the freshwater zones. However, the variations in the rates of compliance or non-compliance with the mandatory or guide values must be put into the context of the small number of bathing areas taken into account in the freshwater zones.

In the coastal areas, the results show a slight but constant improvement in average bathing water quality. The percentages of bathing areas complying with the guide values (54.3 %) and/or mandatory values (94.4 %) increased by 3.8 and 2.9 % respectively. However, the percentage of bathing areas complying with the guide values is still quite small and ought to be improved. The percentage of bathing areas not complying with the mandatory values fell by 3 %, to 5.6 % in the 2000 bathing season.

In the freshwater zones, the situation was the opposite, since there has been a constant deterioration in average bathing area quality since the last two bathing seasons. The percentage of bathing areas complying with the mandatory values fell from 100 % during the 1998 bathing season to 90.9 % a year later, and slipped further to 81.8 % during the 2000 season. After a year in which it had risen for the first time, the percentage of bathing areas complying with the stricter guide values fell to only 18.2 % during the 2000 bathing season. This was accompanied by a rise to 18.2 % in the percentage of bathing areas failing to comply with the mandatory values in the 2000 bathing season. No bathing areas were insufficiently sampled and there were no areas where bathing was prohibited.

The six bathing areas in Gibraltar all complied with the mandatory values (100 %), but only three (50 %) also complied with the stricter guide values. There has been no change since the previous bathing season.

5. General information (1)

Wastewater treatment

The United Kingdom has adopted a broad strategy to improve the compliance of its bathing waters with the standards laid down by the Community directive. This includes investigating the main causes of non-compliance and a process of risk identification and is to be followed by improvement schemes to deal directly with the sources of contamination identified. Targeted projects will be carried out and the improvement programme (costing more than GBP 600 million) plans to achieve compliance thresholds of 97 % by 2005, with improvements planned for more than 100 permanent disposal sites and several hundred provisional sites which affect bathing water. The disinfecting of effluent by means of ultraviolet irradiation is due to start in more than 70 wastewater treatment plants, bringing to 120 the number of plants equipped to carry out such treatment. About GBP 450 million of this budget will therefore be directed towards significantly improving compliance with bathing water standards.

6. Infringement procedure

Given the absence of measures to comply with the Court of Justice's 1993 judgment (Fylde Coast — Blackpool), the Commission has decided to bring proceedings before the Court pursuant to Article 228 of the Treaty.

Proceedings were brought against the United Kingdom in November 2000 pursuant to Article 226 for non-compliance.

(1) The information given in this section is as presented by the Member States to the Commission and is reproduced unamended in this report. The Commission does not express any opinion on the national measures or policies adopted regarding public information or wastewater treatment.

7. Analysis of the changes

Table 2 — Cross-reference table (bathing season 1999 and 2000)

Coastal zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		1	0	0	31	0	221	298	551
NEW	11					0	2	9	11
Ban	0								0
NS	0								0
NC	46				9		22	15	46
Freq	0								0
C (I)	222				18		143	61	222
C (G)	273				4		54	214	272
Tot. 99	541	1	0	0	31	0	219	290	366

Coastal zones (ratio = 1.3; stability = 67.7 %)

The ratio of 1.3 shows that the average status of bathing areas improved slightly compared with the previous bathing season. One factor reinforcing this trend is that 11 new bathing areas were taken into account in the 2000 bathing season, the vast majority of which complied with the guide values.

The low stability index merits comment, considering that the quality of coastal zones generally seems more easily maintainable from one bathing season to the next than that of freshwater zones. The low index reflects a large number of changes, which fortunately relate to improvements in status from one bathing season to the next. Indeed, over 11 % of the bathing areas taken into account during the previous bathing season and which complied with the mandatory values have achieved compliance with the stricter guide values, while fewer than 10 % of the bathing areas found to comply with the guide values during the 1999 bathing season have slipped the other way.

Similarly, while somewhat remarkably over 80 % of the non-complying bathing areas have achieved compliance with the mandatory or guide values, a significant (though smaller) number of bathing areas have slipped into non-compliance.

Freshwater zones (TC, FC, MO, SA, PHE)

	2000	DEL	Ban	NS	NC	Freq	C (I)	C (G)	Tot. 00
1999		0	0	0	2	0	7	2	11
NEW	0								0
Ban	0								0
NS	0								0
NC	1						1		1
Freq	0								0
C (I)	6						5	1	6
C (G)	4				2		1	1	4
Tot. 99	11	0	0	0	2	0	7	2	6

Freshwater zones (ratio = 0.67; stability = 54.5 %)

The ratio of 0.67 reflects a fall in the average quality of freshwater bathing areas compared with the previous bathing season. As with the coastal zones, the stability index is fairly low. However, the ratio and stability index figures need to be seen in context, given the very small number of bathing areas involved.

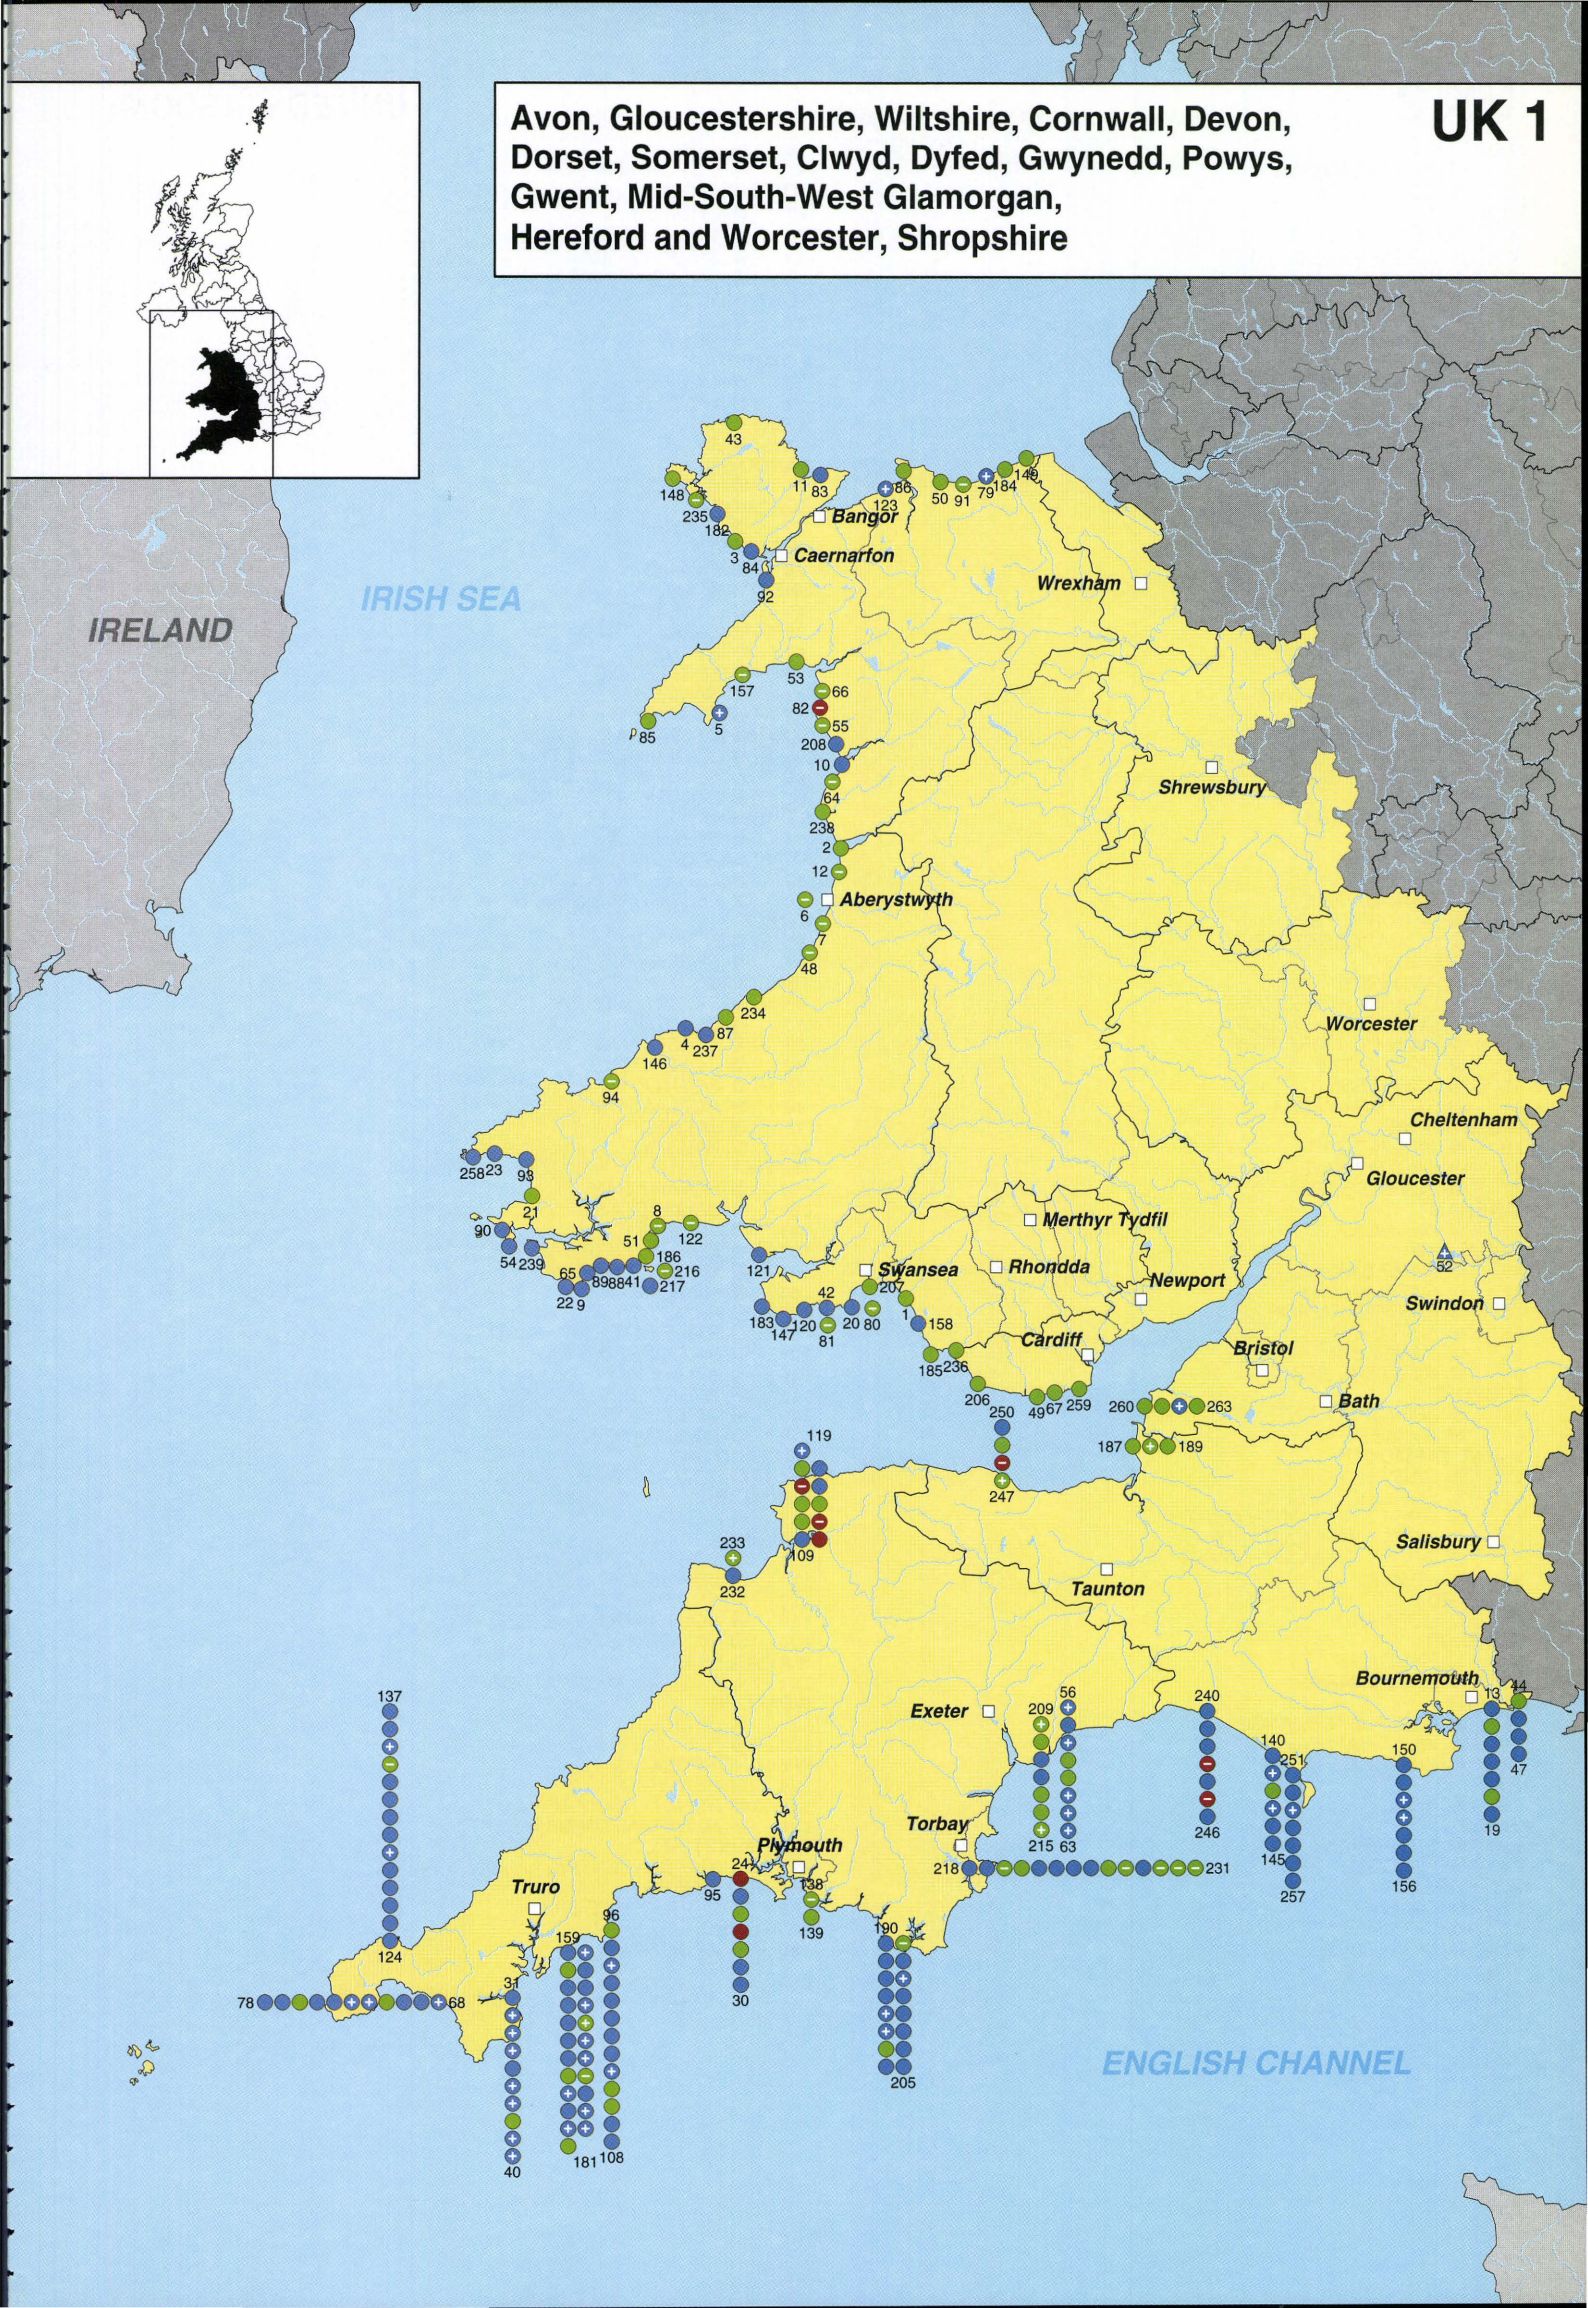

It will be seen, indeed it is striking, that two of the four bathing areas which complied with the guide values during the 1999 bathing season have slipped to non-compliance with the mandatory values. Only one area has achieved compliance with the stricter guide values.

It is unfortunate that so few bathing areas are being taken into account in freshwater zones and that it is proving difficult to maintain their status from one bathing season to the next.

ANNEX

DIRECTIVE 76/160/EEC

COUNCIL DIRECTIVE

of 8 December 1975

concerning the quality of bathing water

(76/160/EEC)

(OJ L 31, 5.2.1976)

THE COUNCIL OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Economic Community, and in particular Articles 100 and 235 thereof,

Having regard to the proposal from the Commission,

Having regard to the opinion of the European Parliament ⁽¹⁾,

Having regard to the opinion of the Economic and Social Committee ⁽²⁾,

Whereas, in order to protect the environment and public health, it is necessary to reduce the pollution of bathing water and to protect such water against further deterioration;

Whereas surveillance of bathing water is necessary in order to attain, within the framework of the operation of the common market, the Community's objectives as regards the improvement of living conditions, the harmonious development of economic activities throughout the Community and continuous and balanced expansion;

Whereas there exist in this area certain laws, regulations or administrative provisions in Member States which directly affect the functioning of the common market; whereas however, not all the powers needed to act in this way have been provided for in the Treaty;

Whereas the programme of action of the European Communities on the environment ⁽³⁾ provides that quality objectives are to be jointly drawn up fixing the various

requirements which an environment must meet *inter alia* the definition of parameters for water, including bathing water;

Whereas, in order to attain these quality objectives, the Member States must lay down limit values corresponding to certain parameters; whereas bathing water must be made to conform to these values within 10 years following the notification of this directive;

Whereas it should be provided that bathing water will, under certain conditions, be deemed to conform to the relevant parametric values even if a certain percentage of samples taken during the bathing season does not comply with the limits specified in the annex;

Whereas, to achieve a certain degree of flexibility in the application of this directive, the Member States must have the power to provide for derogations; whereas such derogations must not, however, disregard requirements essential for the protection of public health;

Whereas technical progress necessitates rapid adaptation of the technical requirements laid down in the annex; whereas, in order to facilitate the introduction of the measures required for this purpose, a procedure should be provided for whereby close cooperation would be established between the Member States and the Commission within a committee on adaptation to technical progress;

⁽¹⁾ OJ C 128, 9.6.1975, p. 13.

⁽²⁾ OJ C 286, 15.12.1975, p. 5.

⁽³⁾ OJ C 112, 20.12.1973, p. 3.

Whereas public interest in the environment and in the improvement of its quality is increasing; whereas the public should therefore receive objective information on the quality of bathing water,

HAS ADOPTED THIS DIRECTIVE:

Article 1

1. This directive concerns the quality of bathing water, with the exception of water intended for therapeutic purposes and water used in swimming pools.

2. For the purposes of this directive:

(a) 'bathing water' means all running or still fresh waters or parts thereof and sea water, in which:

- bathing is explicitly authorised by the competent authorities of each Member State, or
- bathing is not prohibited and is traditionally practised by a large number of bathers;

(b) 'bathing area' means any place where bathing water is found;

(c) 'bathing season' means the period during which a large number of bathers can be expected, in the light of local custom, and any local rules which may exist concerning bathing and weather conditions.

Article 2

The physical, chemical and microbiological parameters applicable to bathing water are indicated in the annex which forms an integral part of this directive.

Article 3

1. Member States shall set, for all bathing areas or for each individual bathing area, the values applicable to bathing water for the parameters given in the annex.

In the case of the parameters for which no values are given in the annex, Member States may decide not to fix any values pursuant to the first subparagraph, until such time as figures have been determined.

2. The values set pursuant to paragraph 1 may not be less stringent than those given in Column I of the annex.

3. Where values appear in Column G of the annex, whether or not there is a corresponding value in Column I of the annex, Member States shall endeavour, subject to Article 7, to observe them as guidelines.

Article 4

1. Member States shall take all necessary measures to ensure that, within 10 years following the notification of this directive, the quality of bathing water conforms to the limit values set in accordance with Article 3.

2. Member States shall ensure that, in bathing areas specially equipped for bathing to be created by the competent authorities of the Member States after the notification of this directive, the 'I values' laid down in the annex are observed from the time when bathing is first permitted. However, for bathing areas created during the two years following the notification of this directive, these values need not be observed until the end of that period.

3. In exceptional circumstances Member States may grant derogations in respect of the 10-year time limit laid down in paragraph 1. Justification for any such derogations based on plans for the management of water within the area concerned must be communicated to the Commission as soon as possible and not later than six years following the notification of this directive. The Commission shall examine these justifications in detail and, where necessary, make appropriate proposals concerning them to the Council.

4. As regards sea water in the vicinity of frontiers and water crossing frontiers which affect the quality of the bathing water of another Member State, the consequences for the common quality objectives for bathing areas so affected shall be determined in collaboration by the riparian Member States concerned.

The Commission may participate in these deliberations.

Article 5

1. For the purposes of Article 4, bathing water shall be deemed to conform to the relevant parameters:

if samples of that water, taken at the same sampling point and at the intervals specified in the annex, show that it conforms to the parametric values for the quality of the water concerned, in the case of:

- 95 % of the samples for parameters corresponding to those specified in Column I of the annex;
- 90 % of the samples in all other cases with the exception of the 'total coliform' and 'faecal coliform' parameters where the percentage may be 80 %;

and if, in the case of the 5, 10 or 20 % of the samples which do not comply:

- the water does not deviate from the parametric values in question by more than 50 %, except for microbiological parameters, pH and dissolved oxygen;
- consecutive water samples taken at statistically suitable intervals do not deviate from the relevant parametric values.

2. Deviations from the values referred to in Article 3 shall not be taken into consideration in the calculation of the percentage referred to in paragraph 1 when they are the result of floods, other natural disasters or abnormal weather conditions.

Article 6

1. The competent authorities in the Member States shall carry out sampling operations, the minimum frequency of which is laid down in the annex.

2. Samples should be taken at places where the daily average density of bathers is highest. Samples should preferably be taken 30 cm below the surface of the water except for mineral oil samples which shall be taken at surface level. Sampling should begin two weeks before the start of the bathing season.

3. Local investigation of the conditions prevailing upstream in the case of fresh running water, and of the ambient conditions in the case of fresh still water and sea water should be carried out scrupulously and repeated periodically in order to obtain geographical and topographical data and to determine the volume and nature of all polluting and potentially polluting discharges and their effects according to the distance from the bathing area.

4. Should inspection by a competent authority or sampling operations reveal that there is a discharge or a probable discharge of substances likely to lower the quality of the bathing water, additional sampling must take place. Such additional sampling must also take place if there are any other grounds for suspecting that there is a decrease in water quality.

5. Reference methods of analysis for the parameters concerned are set out in the annex. Laboratories which employ other methods must ensure that the results obtained are equivalent or comparable to those specified in the annex.

Article 7

1. Implementation of the measures taken pursuant to this directive may under no circumstances lead either directly or indirectly to deterioration of the current quality of bathing water.

2. Member States may at any time fix more stringent values for bathing water than those laid down in this directive.

Article 8

This directive may be waived:

- (a) in the case of certain parameters marked (0) in the annex, because of exceptional weather or geographical conditions;
- (b) when bathing water undergoes natural enrichment in certain substances causing a deviation from the values prescribed in the annex.

Natural enrichment means the process whereby, without human intervention, a given body of water receives from the soil certain substances contained therein.

In no case may the exceptions provided for in this article disregard the requirements essential for public health protection.

Where a Member State waives the provisions of this directive, it shall forthwith notify the Commission thereof, stating its reasons and the periods anticipated.

Article 9

Such amendments as are necessary for adapting this directive to technical progress shall relate to:

- the methods of analysis;
- the G and I parameter values set out in the annex.

They shall be adopted in accordance with the procedure laid down in Article 11.

Article 10

1. A committee on adaptation to technical progress (hereinafter called 'the committee') is hereby set up. It shall consist of representatives of the Member States and be chaired by a representative of the Commission.

2. The committee shall draw up its own rules of procedure.

Article 11

1. Where the procedure laid down in this article is to be followed, matters shall be referred to the committee by the chairman, either on his own initiative or at the request of the representative of a Member State.

2. The representative of the Commission shall submit to the committee a draft of the measures to be adopted. The committee shall deliver its opinion on the draft within a time limit set by the chairman having regard to the urgency of the matter. Opinions shall be adopted by a majority of 41 votes, the votes of the Member States being weighted as provided in Article 148 (2) of the Treaty. The chairman shall not vote.

3. (a) The Commission shall adopt the measures envisaged where they are in accordance with the opinion of the committee.

(b) Where the measures envisaged are not in accordance with the opinion of the committee, or if no opinion is adopted, the Commission shall without delay propose to the Council the measures to be adopted. The Council shall act by a qualified majority.

(c) If, within three months of the proposal being submitted to it, the Council has not acted, the proposed measures shall be adopted by the Commission.

Article 12

1. Member States shall bring into force the laws, regulations and administrative provisions necessary to comply with this directive within two years of its notification. They shall forthwith inform the Commission thereof.

2. Member States will communicate to the Commission the texts of the main provisions of national law which they adopt in the field covered by this directive.

Article 13

Member States shall, four years following the notification of this directive and at regular intervals thereafter, submit a comprehensive report to the Commission on their bathing water and the most significant characteristics thereof.

After prior consent has been obtained from the Member State concerned the Com-

mission may publish the information obtained.

Article 14

This directive is addressed to the Member States.

Done at Brussels, 8 December 1975.

For the Council
The President
M. PEDINI

Annex

Quality requirements for bathing water

	Parameters	G	I	Minimum sampling frequency	Method of analysis and inspection
1	Microbiological <i>Total coliforms/100 ml</i>	500	10 000	Fortnightly (1)	<i>Fermentation in multiple tubes. Subculturing of the positive tubes on a confirmation medium.</i> <i>Count according to MPN (most probable number)</i> <i>or</i>
2	<i>Faecal coliforms/100 ml</i>	100	2 000	Fortnightly (1)	<i>membrane filtration and culture on an appropriate medium such as Tergitol lactose agar, endo-agar, 0.4 % Teepol broth, subculturing and identification of the suspect colonies.</i> <i>In the case of 1 and 2, the incubation temperature is variable according to whether total or faecal coliforms are being investigated.</i>
3	<i>Faecal streptococci/100 ml</i>	100	—	(2)	<i>Litsky method</i> <i>Count according to MPN (most probable number)</i> <i>or filtration on membrane</i> <i>Culture on an appropriate medium</i>
4	<i>Salmonella/litre</i>	—	0	(2)	<i>Concentration by membrane filtration</i> <i>Inoculation on a standard medium</i> <i>Enrichment — subculturing on isolating agar — identification</i>
5	<i>Enteroviruses PFU/10 litres</i>	—	0	(2)	<i>Concentrating by filtration flocculation or centrifuging and confirmation</i>
6	Physico-chemical <i>pH</i>	—	6-9 (0)	(2)	<i>Electrometry with calibration at pH 7 and 9</i>

	Parameters	G	I	Minimum sampling frequency	Method of analysis and inspection
7	Colour	— —	No abnormal change in colour (0) —	Fortnightly (1) (2)	Visual inspection or photometry with standards on the Pt. Co scale
8	Mineral oils mg/litre	— ≤ 0.3	No film visible on the surface of the water and no odour —	Fortnightly (1) (2)	Visual and olfactory inspection or extraction using an adequate volume and weighing the dry residue
9	Surface-active substances reacting with methylene blue (Lauryl sulfate) mg/l	— ≤ 0.3	No lasting foam —	Fortnightly (1) (2)	Visual inspection or absorption spectrophotometry with methylene blue
10	Phenols mg/l (phenol indices) C_6H_5OH	— ≤ 0.005	No specific odour ≤ 0.05	Fortnightly (1) (2)	Verification of the absence of specific odour due to phenol or absorption spectrophotometry 4-aminoantipyrine (4 AAP) method
11	Transparency m	2	1 (0)	Fortnightly (1)	Secchi's disc
12	Dissolved oxygen % saturation O_2	80 to 120	—	(2)	Winkler's method or electrometric method (oxygen metre)
13	Tarry residues and floating materials such as wood, plastic articles, bottles, containers of glass, plastic, rubber or any other substance. Waste or splinters	Absence		Fortnightly (1)	Visual inspection
14	Ammonia mg/l NH_4			(3)	Absorption spectrophotometry, Nessler's method or indophenol blue method
15	Nitrogen Kjeldahl mg/litre N			(3)	Kjeldahl method

	Parameters	G	I	Minimum sampling frequency	Method of analysis and inspection
16	Other substances regarded as indications of pollution: Pesticides mg/litre (parathion, HCH, dieldrin)			(2)	Extraction with appropriate solvents and chromatographic determination
17	Heavy metals such as: arsenic mg/litre As cadmium Cd chrome VI Cr VI lead Pb mercury Hg			} (2)	Atomic absorption possibly preceded by extraction
18	Cyanides mg/litre Cn			(2)	Absorption spectrophotometry using a specific reagent
19	Nitrates mg/litre NO ₃ and Phosphates PO ₄			(3)	Absorption spectrophotometry using a specific reagent

G = guide

I = mandatory

(0) Provision exists for exceeding the limits in the event of exceptional geographical or meteorological conditions.

(1) When a sampling taken in previous years produced results which are appreciably better than those in this annex and when no new factor likely to lower the quality of the water has appeared, the competent authorities may reduce the sampling frequency by a factor of 2.

(2) Concentration to be checked by the competent authorities when an inspection in the bathing area shows that the substance may be present or that the quality of the water has deteriorated.

(3) These parameters must be checked by the competent authorities when there is a tendency towards eutrophication of the water.
